Major Features and Benefits

The SEL-451-5 Protection, Automation, and Bay Control System integrates bay control for breakers and disconnect switches with full automation and protection in one device.

➤ **Protection.** Customize distribution protection with multiple instantaneous and time-overcurrent elements with SEL-LOGIC control equations. Best Choice Ground Directional Element logic optimizes directional element performance and eliminates the need for many directional settings. Provide comprehensive protection for two breakers with one relay.

➤ **Commissioning.** Rapidly commission your Bay Control with preconfigured bay arrangements. Choose among different bus configurations, including single- and dual-busbar, transfer bus, tie breaker, breaker-and-a-half, ring-bus, double-bus/double-breaker, and source transfer configurations. These bus arrangements allow easy status and control of as many as ten disconnect switches and two breakers. Additional user-selectable bay types are available via ACSELERATOR QuickSet SEL-5030 Software that can be downloaded at selinc.com.

➤ **Automation.** Take advantage of enhanced automation features that include 32 programmable elements for local control, remote control, protection latching, and automation latching. Local metering on the large format front-panel Liquid Crystal Display (LCD) eliminates the need for separate panel meters. Serial and Ethernet links efficiently transmit key information, including metering data, protection element and control input/output (I/O) status, IEEE C37.118 Synchrophasors, IEC 61850 GOOSE messages, Sequential Events Recorder (SER) reports, breaker monitor, relay summary event reports, and time synchronization. Apply expanded SEL-LOGIC control equations with math and comparison functions in control applications. Incorporate as many as 1000 lines of automation logic to speed and improve control actions.

➤ **Synchrophasors.** Make informed load dispatch decisions based on actual real-time phasor measurements from SEL-451-5 relays across your power system. Record streaming synchrophasor data from SEL-451-5 relays for system-wide disturbance recording. Control the power system using local and remote synchrophasor data.

➤ **High-impedance Fault Detection.** The optional high-impedance fault (HIF) detection element operates for small current ground faults typically caused by downed conductors on surfaces such as earth, concrete or other poorly conductive materials. HIF event data are made available in standard COMTRADE format.

➤ **Ethernet Access.** Access all relay functions with the optional Ethernet card. Interconnect with automation systems by using IEC 61850 or DNP3 protocol directly. Use file transfer protocol (FTP) for high-speed data collection. Connect to substation or corporate LANs to transmit synchrophasors in the IEEE C37.118–2005 format by using TCP or UDP Internet protocols.
- **Parallel Redundancy Protocol (PRP).** Provide seamless recovery from any single Ethernet network failure, in accordance with IEC 62439-3. The Ethernet network and all traffic are fully duplicated with both copies operating in parallel.

- **IEEE 1588, Precision Time Protocol.** The relay shall support Precision Time Protocol version 2 (PTPv2). PTP provides high-accuracy timing over an Ethernet network.

- **Digital Relay-to-Relay Communications.** Enhanced MIRRORED BITS® communications can monitor internal element conditions between bays within a station, or between stations, using SEL fiber-optic transceivers. Send digital, analog, and virtual terminal data over the same MIRRORED BITS channel.

- **Monitoring.** Schedule breaker maintenance when accumulated breaker duty (independently monitored for each pole of two circuit breakers) indicates possible excess contact wear. Electrical and mechanical operating times are recorded for both the last operation and the average of operations since function reset. Two independent DC monitors provide notification of substation battery voltage problems even if voltage is low only during trip or close operations.

- **Breaker Failure.** High-speed (less than one cycle) open-pole detection logic reduces coordination times for critical breaker failure applications. Apply the SEL-451-5 to supply breaker failure protection for one or two breakers. Logic for breaker failure retrip and initiation of transfer tripping is included.

- **Sequential Events Recorder (SER).** Record the last 1000 events, including setting changes, power-ups, and selectable logic elements.

- **Dual CT Input.** Apply with ring bus, breaker-and-a-half, or other two-breaker schemes. Combine currents within the relay from two sets of CTs for protection functions, but keep them separately available for monitoring and station integration applications.

- **Comprehensive Metering.** Improve feeder loading by using built-in, high-accuracy metering functions. Watt and VAR measurements optimize feeder operation. Minimize equipment needs with full metering capabilities including rms, maximum/minimum, demand/peak, energy, and instantaneous values.

- **High-Accuracy Time-Stamping.** Time-tag binary COMTRADE event reports with real-time accuracy of better than 10 µs. View system state information to an accuracy of better than 1/4 of an electrical degree.

- **Oscillography and Event Reporting.** Record voltages, currents, and internal logic points at a sampling rate as fast as 8 kHz. Off line phasor and harmonic-analysis features allow investigation of bay and system performance.

- **Reclosing.** Incorporate programmable reclosing of one or two breakers into an integrated substation control system. Synchronism and voltage checks from multiple sources provide complete bay control.

- **Fault Locator.** Efficiently dispatch line crews to quickly isolate line problems and restore service faster.

- **Thermal Overload Modeling.** Communicate with the SEL-2600 RTD Module for dynamic overload protection through use of SElogic control equations.

- **Rules-Based Settings Editor.** Communicate with and set the relay by using an ASCII terminal, or use the PC-based acSelerator QuickSet software to configure the SEL-451-5 and analyze fault records with relay element response.

- **Auxiliary Trip/Close Pushbuttons.** These optional pushbuttons are electrically isolated from the rest of the relay. They function independently from the relay and do not need relay power.

- **Low-Energy Analog (LEA) Inputs.** Reduce costs and save space with as many as six C37.92-compliant LEA voltage inputs.

- **Time-Domain Link (TiDL) Technology.** The relay supports remote data acquisition through use of an SEL-2240 Axion®. The Axion provides remote analog and digital data over an IEC 61158 EtherCAT® TiDL network. This technology provides very low and deterministic latency over a fiber point-to-point architecture. The SEL-451-5 relay can receive fiber links from as many as eight Axion remote data acquisition nodes.

1 Copper or Fiber Optic  * Optional Feature
Protection Features

Directional Elements Increase Sensitivity and Security

The SEL-451-5 provides multiple directional elements to optimize security and sensitivity. Use ground and negative-sequence directional overcurrent elements to detect high-resistance faults when using communications-assisted tripping schemes.

The SEL-451-5 includes a number of directional elements for supervision of overcurrent elements. The negative-sequence directional element uses the same patented principle proven in our SEL-351 Relay. This directional element can be applied in virtually any application, regardless of the amount of negative-sequence voltage available at the relay location.

Ground overcurrent elements are directionally controlled by three directional elements working together:

- Negative-sequence voltage-polarized directional element
- Zero-sequence voltage-polarized directional element
- Zero-sequence current-polarized directional element

Our patented Best Choice Ground Directional Element selects the best ground directional element for the system conditions and simplifies directional element settings (you can override this automatic setting feature for special applications).
Communications-Assisted Tripping Schemes

Use communications to improve tripping time for better customer service. The SEL-451-5 is the ideal relay for use in pilot-based tripping schemes. Enhanced Mirrored Bits communications with SEL fiber-optic transceivers provide 3–6 ms relay-to-relay transmission time. Among the schemes supported are the following:

➤ Permissive Overreaching Transfer Tripping (POTT)
➤ Directional Comparison Unblocking (DCUB)
➤ Directional Comparison Blocking (DCB)

Use the SELOGIC control equation TRCOMM to program specific elements, combinations of elements, inputs, etc., to perform communications scheme tripping and other scheme functions. The logic readily accommodates the following conditions:

➤ Current reversals
➤ Breaker open at one terminal
➤ Weak-infeed conditions at one terminal
➤ Switch-onto-fault conditions

Overcurrent Elements

The SEL-451-5 includes four phase, four negative-sequence, and four ground instantaneous overcurrent elements. The SEL-451-5 also includes six selectable operating quantity inverse-time overcurrent elements. You can select the operating quantities from the following:

IA, IB, IC, MAX(IA, IB, IC), I1, 3I2, IG

where IA, IB, IC can be fundamental or rms quantities from either circuit breaker or combined currents.

The time-overcurrent curves (listed in Table 1) have two reset characteristic choices for each time-overcurrent element. One choice resets the elements if current drops below pickup for one cycle. The other choice emulates the reset characteristic of an electromechanical induction disc relay.

Breaker Failure Protection

Incorporated into the SEL-451-5 is a full function breaker failure system. Current can be individually monitored in two breakers. High-speed open-pole detection logic allows you to set the pickup current below minimum load for sensitivity without sacrificing high-speed dropout. Even in cases with delayed current zero in the secondary of the CT caused by trapped flux, high-speed detection of circuit breaker opening is achieved. This feature is essential if breaker failure is initiated on all circuit breaker trips. A reset of less than one cycle reduces coordination times, improving stability.

Thermal Overload Protection

The SEL-451-5 supports receipt of Fast Messages from the SEL-2600 RTD Module. Temperature information from the SEL-2600 is placed in predefined analog values and status information is stored in predefined Relay Word bits. For more information, see SEL Application Guide AG2003-06, Implementation of the SEL-49 Relay Line Thermal Protection Using the SEL-421 Relay SELOGIC Equations.

Loss-of-Potential (LOP) Logic Supervises Directional Elements

The SEL-451-5 includes logic to detect an LOP caused by failures such as blown fuses, which can cause an incorrect operation in directional elements. Simple settings configure the LOP logic to either block or force forward ground and phase directional elements under these conditions. The logic checks for a sudden change in positive-sequence voltage without a corresponding change in positive- or zero-sequence current. Tests and field experience show that this principle is very secure and is faster than the tripping elements.

High-Impedance Fault Detection

High-impedance faults are short-circuit faults with fault currents smaller than what a traditional overcurrent protective relay can detect. The SEL-451-5 includes logic used to detect HIF signatures without being affected by loads and other system operation conditions. A running average provides a stable prefault reference and adaptive tuning learns and tunes out feeder ambient noise conditions. Decision logic differentiates an HIF condition from other system conditions such as switching operations and noisy loads. As much as 40 minutes of high-impedance fault activity is stored in high-resolution COMTRADE format and a summary of HIF activity is available using ASCII commands. View important high-impedance fault data from available metering commands.
Six Independent Settings Groups Increase Operation Flexibility

The relay stores six settings groups. Select the active settings group by control input, command, or other programmable conditions. Use these settings groups to cover a wide range of control contingencies. Selectable settings groups make the SEL-451-5 ideal for applications requiring frequent settings changes and for adapting the bay to changing system conditions.

Selecting a group also selects logic settings. Program group logic to adjust settings for different operating conditions, such as station maintenance, seasonal operations, emergency contingencies, loading, source changes, and adjacent relay settings changes.

Combined Current for Protection Flexibility

In traditional relays, when protecting a line fed from two breakers, such as a breaker-and-a-half system or double-breaker system, you needed to combine the CT inputs before connecting these inputs to the relay. The SEL-451-5 can accept separate inputs from two separate CTs and mathematically combine the currents. This allows collecting separate current metering and breaker monitoring information for each breaker. Breaker monitoring functions for two breakers are done within one relay. Individual breaker currents allow for breaker failure functions on a per-breaker basis within the SEL-451-5. Breaker diagnostics are reported on a comparative basis allowing for advanced, proactive troubleshooting.

Custom Control Capabilities

Customize control capabilities, adding stability and security to your system.

➤ Use expanded SELogic control equations to create advanced stability enhancements such as VAR-flow controlled time undervoltage load shedding.
➤ Combine frequency elements with voltage supervision for added security with underfrequency load-shedding systems.

Control Inputs and Outputs

The standard SEL-451-5 includes five independent and two common inputs, two Form A and three Form C standard interrupting outputs, and three Form A high-current interrupting outputs. The following additional input/output (I/O) boards are currently available.

➤ Eight independent inputs, 13 standard Form A and two standard Form C contact outputs.
➤ Eight independent inputs, eight high-speed, high-current interrupting Form A contact outputs.
➤ Eight independent inputs, 13 high-current interrupting Form A outputs and two standard Form C contact outputs.
➤ Twenty-four inputs, six high-speed and two standard Form A contact outputs.

Assign the control inputs for protection and control functions, monitoring logic, and general indication. Each control output is programmable using SELogic control equations. No additional I/O boards can be added to the 3U chassis; however, one board can be added to the 4U chassis, and two additional I/O boards can be added to the 5U chassis.
Multifunction Reclosing With Flexible Applications

Figure 4 Two-Breaker Reclosing With Synchronism Check

The SEL-451-5 includes three-pole trip and reclose functions, for either one or two breakers (Figure 4). Synchronism check is included for breaker control. Synchronizing and polarizing voltage inputs are fully programmable with Dead Line/Dead Bus closing logic as well as zero-closing-angle logic to minimize system stress upon reclosing. Program as many as four reclose attempts. Select Leader and Follower breakers directly, or use a SELOGIC control equation to determine reclosing order based on system conditions.

Two-Breaker Control

The SEL-451-5 contains analog voltage inputs for multiple sources and control inputs to indicate both breaker and disconnect position, as well as the logic required to provide full control for two breakers. This includes separate monitoring functions as well as separate elements for tripping and closing the two breakers to allow for leader/follower operation or other desired control schemes. All analog values are monitored on a per-breaker basis to allow station control access to complete information for individual components of the system.

Backup Protection

Add reliability and dependability by providing independent backup protection without increasing relay count. Use each SEL-451-5 to provide primary directional overcurrent protection with backup nondirectional overcurrent protection on the adjacent feeder. For additional flexibility, use the available I/O or MIRRORED BITS to switch protection upon loss of one relay.

Bay Control

The SEL-451-5 Bay Control provides dynamic bay one-line diagrams on the front-panel screen with disconnect and breaker control capabilities for numerous predefined user-selectable bay types. Additional user-selectable bay types are available via an ACSELERATOR QuickSet interface that can be downloaded at selinc.com. The bay control is equipped to control as many as 10 disconnects and two breakers, depending on the one-line diagram selected. Certain one-line diagrams provide status for as many as three breakers and ten disconnect switches. Operate disconnects and breakers with ASCII commands, SELOGIC control equations, Fast Operate Messages, and from the one-line diagram. The one-line diagram includes user-configurable apparatus labels and as many as 24 user-definable Analog Quantities.

One-Line Bay Diagrams

The SEL-451-5 offers a variety of preconfigured one-line diagrams for common bus configurations. Once a one-line diagram is selected, the user has the ability to customize the names for all of the breakers, disconnect switches, and buses. Most one-line diagrams contain analog display points. These display points can be set to any of the available analog quantities with labels, units, and scaling. These values are updated real-time along with the breakers and switch position to give instant status and complete control of a bay. The diagrams below demonstrate some of the preconfigured bay arrangements available in the SEL-451-5.

The operator can see all valuable information on a bay before making a critical control decision. Programmable interlocks help prevent operators from incorrectly opening or closing switches or breakers. The SEL-451-5 will not only prevent the operator from making an incorrect
control decision, but can notify and/or alarm when an incorrect operation is initiated.

### Circuit Breaker Operations From the Front Panel

*Figure 6* through *Figure 9* are examples of some of the many selectable one-line diagrams in the SEL-451-5. The one-line diagram is selectable from the Bay settings. Additional settings for defining labels and analog quantities are also found in the Bay settings. One-line diagrams are composed of the following:

- Bay Names and Bay Labels (Bay Labels available in one-line diagrams 14, 17, 18, and 23. All other one-line diagrams use the Bay Name.)
- Busbar and Busbar Labels
- Breaker and Breaker Labels
- Disconnect Switches and Disconnect Switch Labels
- Analog Display Points

*Figure 10* shows the Breaker Control Screens available when the **ENT** pushbutton is pressed with the circuit breaker highlighted as shown in *Figure 10* (a). After pressing the **ENT** pushbutton with the breaker highlighted and the LOCAL Relay Word bit asserted, the Breaker Control Screen in *Figure 10* (b) is displayed. After entering the screen in *Figure 10* (b), the relay performs the circuit breaker operations as outlined in the SEL-451-5 *User’s Guide*. If the LOCAL Relay Word bit is not asserted when the **ENT** pushbutton is pressed, the screen in *Figure 10* (c) is displayed for three seconds, then the bay control displays again the screen in *Figure 10* (a).
**Rules-Based Settings Editor**

ACSELERATOR QuickSet develops settings on- or offline. The system automatically checks interrelated settings and highlights out-of-range settings. Settings are transferred by using a PC communications link with the SEL-451-5. The ACSELERATOR QuickSet interface supports Server 2008, Windows® 7 and Windows 8 operating systems, and can be used to open COMTRADE files from SEL and other products. Convert binary COMTRADE files to ASCII format for portability and ease of use. View real-time phasors and harmonic values.

**ACSELERATOR QuickSet Bay Control Settings Interface**

There are two ways to enter Bay Control settings by using the ACSELERATOR QuickSet settings interface. The standard style settings are displayed in traditional form under the Bay Control form. ACSELERATOR QuickSet also provides an interactive bay control setting entry method. The interactive method works by clicking on the one-line diagram labels. This action automatically displays all the settings for the device selected. This method provides an easy way of organizing and verifying all settings associated with the device.

*Figure 11* illustrates the interactive bay control setting form in ACSELERATOR QuickSet. Click on an apparatus in the one-line diagram, and a form with apparatus-specific settings is displayed.

**ACSELERATOR QuickSet Templates**

Use the fully licensed version of ACSELERATOR QuickSet to create custom views of settings, called Application Designs, to reduce complexity, decrease the chance of errors, and increase productivity.

➤ Lock and hide unused settings.
➤ Lock settings to match your standard for protection, I/O assignment, communications, and SELOGIC control equations.
➤ Enforce settings limits narrower than the device settings.
➤ Define input variables based on the equipment nameplate or manufacturer’s terminology or scaling and calculate settings from these “friendlier” inputs.
➤ Use settings comments to guide users and explain design reasoning.
Front-Panel Display

The liquid crystal display (LCD) shows event, metering, settings, and relay self-test status information. The target LEDs display relay target information as described in Figure 12 and explained in Table 2.

The LCD is controlled by the navigation pushbuttons (Figure 14), automatic messages the relay generates, and programmable analog and digital display points. The rotating display scrolls through the bay screen, alarm points, display points, and metering screens. Each display remains for an adjustable time (1–15 seconds) before the display continues scrolling. Any message generated by the relay because of an alarm condition takes precedence over the rotating display.
Close-up views of the front panel of the SEL-451-5 are shown in Figure 12, Figure 13, and Figure 14. The front panel includes a 128 x 128 pixel, 3" x 3" LCD screen; LED target indicators; and pushbuttons with indicating LEDs for local control functions. The asserted and deasserted colors for the LEDs are programmable. Configure any of the direct-acting pushbuttons to navigate directly to an HMI menu item, such as events, bay display, alarm points, display points, or the SER.

Status and Trip Target LEDs

The SEL-451-5 includes programmable target LEDs, as well as programmable direct-action control pushbuttons/LEDs on the front panel. These LEDs and pushbuttons are shown in Figure 12 and Figure 13. Default Target LED assignments are explained in Table 2.

The SEL-451-5 features a versatile front panel that you can customize to fit your needs. Use SELOGIC control equations and slide-in configurable front-panel labels to change the function and identification of target LEDs and operator control pushbuttons and LEDs. The blank slide-in label set is included with the SEL-451-5. Label sets can be printed from a laser printer using templates supplied with the relay or hand labeled on supplied blank labels.

Advanced Display Points

Create custom screens showing metering values, special text messages, or a mix of analog and status information with programmable display points. Figure 15 shows an example of how display points can be used to show circuit breaker information and current metering. As many as 96 display points can be created. All display points occupy one, and only one, line on the display at all times. The height of the line is programmable as either single or double as shown in Figure 15. These screens become part of the autoscrolling display when the front panel times out.

Alarm Points

You can display messages on the SEL-451-5 front-panel LCD that indicate alarm conditions in the power system. The relay uses alarm points to place these messages on the LCD.

Figure 16 shows a sample alarm points screen. The relay is capable of displaying as many as 66 alarm points. The relay automatically displays new alarm points while in manual-scrolling mode and in autoscrolling mode. The alarm point messages are assigned using SER Points settings. The asterisk next to the alarm point indicates an active alarm. The inactive alarms can be acknowledged and cleared using the front-panel navigation buttons.
**Figure 16** Sample Alarm Points Screen

**Auxiliary Trip/Close Pushbuttons and Indicating LEDs**

Optional auxiliary trip and close pushbuttons (see Figure 17) and indicating LEDs allow breaker control independent of the relay. The auxiliary trip/close pushbuttons are electrically separate from the relay, operating even if the relay is powered down. Make the extra connections at terminals 201 through 208. See Figure 28 for a rear-panel view. Figure 18 shows one possible set of connections.

The auxiliary trip/close pushbuttons incorporate an arc suppression circuit for interrupting dc trip or close current. To use these pushbuttons with ac trip or close circuits, disable the arc suppression for either pushbutton by changing jumpers inside the SEL-451-5. The operating voltage ranges of the breaker **CLOSED** and breaker **OPEN** indicating LEDs are also jumper-selectable.

**Figure 17** Operator Controls (Auxiliary Trip/Close Model)

**Figure 18** Optional Breaker Trip/Close Control Switches and Indicating Lamps

**Monitoring and Metering**

**Complete Metering Capabilities**

The SEL-451-5 provides extensive metering capabilities as listed in Table 3.

**Event Reporting and Sequential Events Recorder (SER)**

Event Reports and Sequential Events Recorder features simplify post-fault analysis and help improve your understanding of both simple and complex protective scheme operations. These features also aid in testing and troubleshooting bay settings and control schemes. Oscillograms are available in binary COMTRADE and ASCII COMTRADE formats.

**Oscillography and Event Reporting**

In response to a user-selected internal or external trigger, the voltage, current, and element status information contained in each event report confirms relay, scheme, and system performance for every fault. Decide how much detail is necessary when an event report is triggered: 8 kHz, 4 kHz, 2 kHz, or 1 kHz resolution analog data.

The relay stores from 24 seconds of data per fault at 1 kHz resolution to 3 seconds per fault at 8 kHz resolution. Reports are stored in nonvolatile memory. Settings operational in the relay at the time of the event are appended to each event report.

**Event Summary**

Each time the SEL-451-5 generates a standard event report, it also generates a corresponding Event Summary. This is a concise description of an event that includes bay/terminal identification, event date and time, fault location, phase voltages, fault type at time of trip, and trip and close times of day.

With an appropriate setting, the relay will automatically send an Event Summary in ASCII text to one or more relay communications ports each time an event report is triggered.

**Sequential Events Recorder (SER)**

Use this feature to gain a broad perspective of relay element operation. Items that trigger an SER entry are selectable and can include input/output change of state, element pickup/dropout, recloser state changes, etc. The relay SER stores the latest 1,000 entries.
Voltage Sag, Swell, Interruption Records

The SEL-451-5 can perform automatic voltage disturbance monitoring for three-phase systems. The voltage sag/swell/interruption (VSSI) recorder uses the VSSI Relay Word bits to determine when to start (trigger) and when to stop recording. The VSSI recorder uses nonvolatile memory, so de-energizing the relay will not erase any stored VSSI data.

The recorded data are available through the VSSI report, which includes date, time, current, voltage, and voltage sag/swell/interruption (VSSI) element status during voltage disturbances, as determined by programmable settings VINT, VSAG, and VSWELL. When the relay is recording a disturbance, entries are automatically added to the VSSI report at one of four rates, depending on the length of the disturbance:

- Once per quarter cycle
- Once per cycle
- Once per 64 cycles
- Once per day

High-Accuracy Time Keeping

Using a combination of IRIG-B and a global positioning satellite, the SEL-451-5 can time-tag oscillography to within 10 µs accuracy. This high accuracy can be combined with the high sampling rate of the relay to synchronize data from across the system with an accuracy of better than 1/4 electrical degree. This allows examination of the power system state at given times, including load angles, system swings, and other system-wide events. Triggering can be via external signal (contact or communications port), set time, or system event. Optimal calibration of this feature requires a knowledge of primary input component (VT and CT) phase delay and error.

A single IRIG-B time-code input synchronizes the SEL-451-5 time to within ±1 ms of the time-source input. A convenient source for this time code is the SEL-2032 Communications Processor (via Serial Port 1 on the SEL-451-5).

Precision Time Protocol (PTP) Time Synchronization

In addition to IRIG-B, the relay can be time-synchronized through the Ethernet network by using IEEE 1588 Precision Time Protocol, version 2 (PTPv2). When connected directly to a grandmaster clock providing PTP at 1-second sync intervals, the relay can be synchronized to an accuracy of ±100 ns. The relay is capable of receiving as many as 32 sync messages per second.

SNTP Time Synchronization

Use simple network time protocol (SNTP) to cost-effectively synchronize SEL-451-5 relays equipped with Ethernet communication to as little as ±1 ms with no time-source delay. Use SNTP as a primary time source, or as a backup to a higher accuracy IRIG-B time input to the relay.

Substation Battery Monitor for DC Quality Assurance

The SEL-451-5 measures and reports the substation battery voltage for two battery systems. Two sets of programmable threshold comparators and associated logic provide alarm and control of two separate batteries and chargers. The relay also provides dual ground detection. Monitor DC system status alarms with an SEL Communications Processor and trigger messages, telephone calls, or other actions.

The measured dc voltage is reported in the METER display via serial port communications, on the LCD, and in the Event Report. Use the event report data to see an oscillographic display of the battery voltage. Monitor the substation battery voltage drops during trip, close, and other control operations.
Breaker Monitor Feature Allows for Wear-Based Breaker Maintenance Scheduling

Circuit breakers experience mechanical and electrical wear at each operation. Effective scheduling of breaker maintenance takes into account the manufacturer’s published data of contact wear versus interruption levels and operation count. The SEL-451-5 dual breaker monitor feature compares the breaker manufacturer’s published data to the integrated actual interrupted current and number of operations.

➤ Every time the breaker trips, the relay integrates interrupted current. When the result of this integration exceeds the threshold set by the breaker wear curve (Figure 21), the bay can alarm via an output contact or the optional front-panel display. With this information, you can schedule breaker maintenance in a timely, economical fashion.

➤ The relay monitors last and average mechanical and electrical interruption time. You can easily determine if operation time is increasing beyond reasonable tolerance to schedule proactive breaker maintenance. You can activate an alarm point if operation time goes beyond a preset value.

➤ Breaker motor run time and breaker inactivity are also monitored.

Time-Domain Link (TiDL) Technology

The SEL-451-5 supports remote data acquisition through use of an SEL Axion with a technology known as TiDL. The Axion provides remote analog and digital data over an IEC 61158 EtherCAT TiDL network. This technology provides very low and deterministic 1.5 ms latency over a point-to-point architecture. The SEL-451-5 Relay can receive as many as eight fiber links from as many as eight Axion remote data acquisition nodes.

The relay supports a number of fixed topologies. The relay maps the voltage and current inputs from the Axion to existing analog quantities in the SEL-451-5 Relay based on the connected topology. This limits the number of settings and makes converting an existing system to TiDL easy. Figure 22 shows sample TiDL topologies. The SEL-451-5 Instruction Manual shows all supported topologies.

Flexible Control Logic and Integration Features

The SEL-451-5 control logic can be used to perform the following:
- Replace traditional panel control switches
- Eliminate remote terminal unit (RTU)-to-bay wiring
- Replace traditional latching relays
- Replace traditional indicating panel lights

Eliminate traditional panel control switches with 32 local control points. Set, clear, or pulse remote control points via serial port commands. Incorporate the remote control points into your control scheme via SELOGIC control equations. Use remote control points for SCADA-type control operations (e.g., trip, close, settings group selection).

Replace traditional latching relays for such functions as “remote control enable” with 32 latching control points. Program latch set and latch reset conditions with SELOGIC control equations. Set or reset the latch control points via control inputs, remote control points, local control points, or any programmable logic condition. The latch control points retain states when the relay loses power.

Replace traditional indicating panel lights and switches with as many as 24 latching target LEDs and as many as 12 programmable pushbuttons with LEDs. Define custom messages (i.e., BREAKER OPEN, BREAKER CLOSED, RECLOSER ENABLED) to report power system or relay con-
ditions on the large format LCD. Control which messages are displayed via SELOGIC control equations by driving the LCD display via any logic point in the relay.

Open Communications Protocols

SELOGIC Control Equations With Expanded Capabilities and Aliases

Expanded SELOGIC control equations put relay logic in the hands of the engineer. Assign inputs to suit your application, logically combine selected bay elements for various control functions, and assign outputs to your logic functions.

Programming SELOGIC control equations consists of combining relay elements, inputs, and outputs with SELOGIC control equation operators (Table 5). Any element in the Relay Word can be used in these equations. For complex or unique applications, these expanded SELOGIC functions allow superior flexibility.

The SEL-451-5 does not require special communications software. ASCII terminals, printing terminals, or a computer supplied with terminal emulation and a serial communications port are all that is required. Table 4 lists a brief description of the terminal protocols.
Add programmable control functions to your relay and automation systems. New functions and capabilities enable use of analog values in conditional logic statements. The following are examples of possible applications of SELOGIC control equations with expanded capabilities.

- Emulate a motor-driven reclose timer, including stall, reset, and drive-to-lockout conditions (refer to Figure 23).
- Scale analog values for SCADA retrieval.
- Initiate remedial action sequence based on load flow before fault conditions.
- Interlock breakers and disconnect switches.
- Restrict breaker tripping in excessive duty situations without additional relays.
- Construct a compensated overvoltage element for open line overvoltage protection.
- Hold momentary change-of-state conditions for SCADA polling.
- Provide a combination of frequency or rate-of-change-of-frequency functions.

 Relay-to-Relay Digital Communications (MIRRORED BITS)

The SEL patented MIRRORED BITS technology provides bidirectional relay-to-relay digital communication (Figure 24). In the SEL-451-5, MIRRORED BITS can operate simultaneously on any two serial ports for three-terminal power system operation.

This bidirectional digital communication creates additional outputs (transmitted MIRRORED BITS) and additional inputs (received MIRRORED BITS) for each serial port operating in the MIRRORED BITS communications mode. Communicated information can include digital, analog, and virtual terminal data. Virtual terminal allows operator access to remote bays through the local bay. These MIRRORED BITS can be used to transfer information between line terminals to enhance coordination and achieve faster tripping. MIRRORED BITS also help reduce total pilot scheme operating time by eliminating the need to close output contacts and debounce contact outputs. Use the dual-port MIRRORED BITS communications capabilities for high-speed communications-assisted schemes applied to three-terminal transmission lines.

Communication

The SEL-451-5 offers the following serial communication features.

- Four independent EIA-232 serial ports.
- Full access to event history, relay status, and meter information.
- Settings and group switching have three levels of password protection.
- DNP3 Level 2 Outstation.
- Patented SEL Fast Message Interleaving of ASCII and binary data for SCADA communications, including access to SER, relay element targets, event data and more.
Network Connection and Integration

Connect the SEL-451-5 to Local Area Networks (LANs) by using the optional Ethernet card. The integrated Ethernet card supports both copper and/or fiber connections with failover protection.

### Ethernet Card

The optional Ethernet card mounts directly in the SEL-451-5. Use popular Telnet applications for easy terminal communications with SEL relays and other devices. Transfer data at high speeds (10 Mbps or 100 Mbps) for fast HMI updates and file uploads. The Ethernet card communicates using File Transfer Protocol (FTP) applications for easy and fast file transfers.

Provide operations with situational awareness of the power system by using IEEE C37.118-2005 Standard for Synchrophasors for Power Systems. Communicate with SCADA and other substation intelligent electronic devices (IEDs) by using DNP3 or IEC 61850 logical nodes and GOOSE messaging.

Choose Ethernet connection media options for primary and standby connections:
- 10/100BASE-T Twisted Pair Network
- 100BASE FX Fiber-Optic Network

### Telnet and FTP

Order the SEL-451-5 with Ethernet communication and use the built-in Telnet and File Transfer Protocol (FTP) that come standard with Ethernet to enhance relay communications sessions. Use Telnet to access relay settings, and metering and event reports remotely using the ASCII interface. Transfer settings files to and from the relay via the high-speed Ethernet port through use of FTP.

### IEEE C37.118 Synchrophasors

The latest IEEE synchrophasor protocol provides a standard method for communicating synchronized phasor measurement data over Ethernet or serial media. The integrated Ethernet card in the SEL-451-5 provides two independent connections by using either TCP/IP, UDP/IP, or a combination thereof. Each connection supports unicast or multicast options for serving data to one or multiple clients simultaneously. Each data stream can support data streams at as fast as 60 frames per second.

### DNP3 LAN/WAN

The DNP3 LAN/WAN option provides the SEL-451-5 with DNP3 Level 2 Outstation functionality over Ethernet. Custom DNP3 data maps can be configured for use with specific DNP3 masters.

### Precision Time Protocol (PTP)

An Ethernet card option with Ports 5A and 5B populated provides the ability to accept IEEE 1588 Precision Time Protocol, version 2 (PTPv2) for data time synchronization. Optional PTP support includes both the Default and Power System (C37.238-2011) PTP Profiles.

### Parallel Redundancy Protocol (PRP)

This protocol is used to provide seamless recovery from any single Ethernet network failure, in accordance with IEC 62439-3. The Ethernet network and all traffic are fully duplicated with both copies operating in parallel.
HTTP Web Server

When equipped with Ethernet communications, the relay can serve read-only web pages displaying certain settings, metering, and status reports. As many as four users can access the embedded HTTP server simultaneously.

![Typical Web Server Default Menu Screen](image)

IEC 61850 Ethernet Communications

IEC 61850 Ethernet-based communications provide interoperability among IEDs within the substation. Logical nodes using IEC 61850 allow standardized interconnection of IEDs from different manufacturers for monitoring and control of the substation. Reduce wiring among various manufacturers’ devices and simplify operating logic with IEC 61850. Eliminate system RTUs by streaming monitoring and control information from IEDs directly to remote SCADA client devices.

The SEL-451-5 can be ordered with embedded IEC 61850 protocol operating on 100 Mbps Ethernet. Use the IEC 61850 Ethernet protocol for relay monitoring and control functions, including the following:

➤ As many as 128 incoming GOOSE messages. The incoming GOOSE messages can be used to control as many as 256 control bits and 256 analog quantities in the relay with <3 ms latency from device to device. These messages provide binary control inputs to the relay for high-speed control functions and monitoring.

➤ As many as eight outgoing GOOSE messages. Outgoing GOOSE messages can be configured for Boolean and/or analog data. Boolean data are provided with <3 ms latency from device to device.

Use outgoing GOOSE messages for high-speed control and monitoring of external breakers, switches, and other devices.

➤ IEC 61850 Data Server. The SEL-451-5 is equipped with embedded IEC 61850 Ethernet protocol that provides data according to pre-defined logical node objects. As many as seven simultaneous client associations are supported by each relay. Relevant Relay Word bits are available within the logical node data, so status of relay elements, inputs, outputs or SELOGIC control equations can be monitored using the IEC 61850 data server provided in the relay.

MMS File Services

This service of IEC 61850 MMS provides support for file transfers completely within an MMS session. All relay files that can be transferred via FTP can also be transferred via MMS file services.

MMS Authentication

When enabled via a setting in the CID file, the relay will require authentication from any client requesting to initiate an MMS session. The client request must be accompanied by the 2AC level password.
ACSELERATOR Architect

Use ACSELERATOR Architect® SEL-5032 Software to manage the logical node data for all IEC 61850 devices on the network. This Windows-based software provides easy-to-use displays for identifying and binding IEC 61850 network data between logical nodes by using IEC 61850-compliant Configured IED Description (CID) files. ACSELERATOR Architect uses CID files to describe the data the IEC 61850 logical node provides within each relay.

**Specifications**

**Compliance**

**General**

**AC Analog Inputs**

- **Sampling Rate:** 8 kHz

**AC Current Input (Secondary Circuits)**

- **Current Rating (With DC Offset at X/R = 10, 1.5 cycles):**
  - 1 A Nominal: 18.2 A
  - 5 A Nominal: 91 A

**Continuous Thermal Rating**

- 1 A Nominal: 3 A
- 5 A Nominal: 15 A

**Saturation Current (Linear) Rating**

- 1 A Nominal: 20 A
- 5 A Nominal: 100 A

**A/D Current Limit**

- **Note:** Signal clipping may occur beyond this limit.
  - 1 A Nominal: 49.5 A
  - 5 A Nominal: 247.5 A

**One-Second Thermal Rating**

- 1 A Nominal: 100 A
- 5 A Nominal: 500 A

**One-Cycle Thermal Rating**

- 1 A Nominal: 250 A peak
- 5 A Nominal: 1250 A peak

**Burden Rating**

- 1 A Nominal: ≤ 0.1 VA @ 1 A
- 5 A Nominal: ≤ 0.5 VA @ 5 A

**AC Voltage Inputs**

- **Three-phase, four-wire (wye) connections are supported.**
- **Rated Voltage Range:** 0–300 V_L-N
- **Ten-Second Thermal Rating:** 600 Vac
- **Burden:** ≤ 0.1 VA @ 125 V

**LEA Voltage Inputs**

- **Rated Voltage Range:** 0–8 V_L-N
- **Ten-Second Thermal Rating:** 300 Vac
- **Input Impedance:** 1 MΩ

**Common Mode Voltage**

- **Operation:** 50 Vac
- **Without Damage:** 300 Vac

**Frequency and Rotation**

- **Nominal Frequency Rating:** 50 ±5 Hz
- **60 ±5 Hz**
- **Phase Rotation:** ABC or ACB
- **Frequency Tracking Range:**
  - 40–65 Hz
  - < 40 Hz = 40 Hz
  - > 65 Hz = 65 Hz
- **Maximum Slew Rate:** 15 Hz/s

**Power Supply**

- **24–48 Vdc**
  - **Rated Voltage:** 24–48 Vdc
  - **Operational Voltage Range:** 18–60 Vdc
  - **Vdc Input Ripple:** 15% per IEC 60255-26:2013
  - **Interruption:** 20 ms at 24 Vdc, 100 ms at 48 Vdc per IEC 60255-26:2013
  - **Burden:** < 35 W

- **48–125 Vdc or 110–120 Vac**
  - **Rated Voltage:** 48–125 Vdc, 110–120 Vac
  - **Operational Voltage Range:** 38–140 Vdc
  - **85–140 Vac**
  - **Rated Frequency:** 50/60 Hz
  - **Operational Frequency Range:** 30–120 Hz
  - **Vdc Input Ripple:** 15% per IEC 60255-26:2013
  - **Interruption:** 14 ms at 48 Vdc, 160 ms at 125 Vdc per IEC 60255-26:2013
  - **Burden:** < 35 W, < 90 VA

- **125–250 Vdc or 110–240 Vac**
  - **Rated Voltage:** 125–250 Vdc, 110–240 Vac
  - **Operational Voltage Range:** 85–300 Vdc
  - **85–264 Vac**
  - **Rated Frequency:** 50/60 Hz
  - **Operational Frequency Range:** 30–120 Hz
  - **Vdc Input Ripple:** 15% per IEC 60255-26:2013
  - **Interruption:** 46 ms at 125 Vdc, 250 ms at 250 Vdc per IEC 60255-26:2013
  - **Burden:** < 35 W, < 90 VA

**Control Outputs**

**Standard**

- **Make:** 30 A
  - **Carry:** 6 A continuous carry at 70°C
  - **4 A continuous carry at 85°C**
- **1s Rating:** 50 A
- **MOV Protection**
  - **(Maximum Voltage):** 250 Vac / 330 Vdc
  - **Pickup/Dropout Time:** ≤ 6 ms, resistive load

**Note:** If the relay is using a remote data acquisition system such as TiDL, the operating times will be delayed by 1.5 ms. Use caution when setting the relay coordination times to account for this added delay. Element operate times will also have this small added delay.

**Compliance**

- Designed and manufactured under an ISO 9001 certified quality management system
- 47 CFR 15B Class A
  - This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference in which case the user will be required to correct the interference at his own expense.
- UL Listed to U.S. and Canadian safety standards (File E212775; NRGU, NRGU7)
- CE Mark

### Control Inputs

**Direct Coupled (Use With DC Signals):**

- **INT1, INT5, and INT6**
  - Interface Boards: 8 inputs with no shared terminals
  - Range: 15–265 Vdc, independently adjustable
  - Accuracy: ±5% ±3 Vdc
  - Maximum Voltage: 300 Vdc
  - Sampling Rate: 2 kHz
  - Typical Burden: 0.24 W @ 125 Vdc

**Optoisolated (Use With AC or DC Signals):**

- **INT2, INT7, and INT8**
  - Main Board: 5 inputs with no shared terminals
  - 2 inputs with shared terminals
  - Interface Boards: 8 inputs with no shared terminals
  - **INT3 and INT4**
    - 6 inputs with no shared terminals
    - 18 inputs with shared terminals (2 groups of 9 inputs, with each group sharing one terminal)
  - Voltage Options: 24 V standard
  - 48, 110, 125, 220, 250 V level sensitive

**Note:** Per IEC 60255-23:1994, using the simplified method of assessment.

**Note:** Make rating per IEEE C37.90-2005.

**Note:** Per IEC 61810-2:2005.
AC Thresholds
(Ratings met only when recommended control input settings are used)
- 24 Vac: Pickup 16.4–30.0 Vac rms
- 48 Vac: Pickup 32.8–60.0 Vac rms; Dropout < 20.3 Vac rms
- 110 Vac: Pickup 75.1–132.0 Vac rms; Dropout < 46.6 Vac rms
- 125 Vac: Pickup 89.6–150.0 Vac rms; Dropout < 53.0 Vac rms
- 220 Vac: Pickup 150.3–264 Vac rms; Dropout < 93.2 Vac rms
- 250 Vac: Pickup 170.6–300 Vac rms; Dropout < 106 Vac rms
- Current Drawn: < 5 mA at nominal voltage
  < 8 mA for 110 V option
- Sampling Rate: 2 kHz

Communications Ports
- EIA-232: 1 Front and 3 Rear
- Serial Data Speed: 300–57600 bps

Communications Card Slot for Optional Ethernet Card
- Ordering Options: 100BASE-FX Fiber Optic Ethernet
- Fiber Type: Multimode
- Wavelength: 1300 nm
- Source: LED
- Connector Type: LC fiber
- Min. TX Power: –19 dBm
- Max. TX Power: –14 dBm
- RX Sensitivity: –32 dBm
- Sys. Gain: 13 dB

Communications Ports for Optional TiDL Interface
- EtherCAT Fiber-Optic
  - Ports: 8
  - Data Rate: Automatic
  - Connector Type: LC fiber
  - Protocols: Dedicated EtherCAT
  - Class 1 LASER/LED
  - Wavelength: 1300 nm
  - Fiber Type: Multimode
  - Link Budget: 11 dB
  - Min. TX Power: –20 dBm
  - Min. RX Sensitivity: –31 dBm
  - Fiber Size: 50–200 μm
  - Approximate Range: 2 km
  - Data Rate: 100 Mbps
  - Typical Fiber Attenuation: –2 dB/km

Time Inputs
- IRIG Input—Serial Port 1
  - Input: Demodulated IRIG-B
  - Rated I/O Voltage: 5 Vdc
  - Operating Voltage Range: 0–8 Vdc
  - Logic High Threshold: ≤ 2.8 Vdc
  - Logic Low Threshold: ≥ 0.8 Vdc
  - Input Impedance: 2.5 kΩ

IRIG-B Input—BNC Connector
- Input: IEEE 1588 PTPv2
- Profiles: Default, C37.238-2011 (Power Profile)
- Synchronization Accuracy: ±100 ns @ 1-second synchronization intervals when communicating directly with master clock

Operating Temperature
- –40° to +85°C (–40° to +185°F)
- Note: LCD contrast impaired for temperatures below –20° and above +70°C. Stated temperature ranges not applicable to UL applications.

Humidity
- 5% to 95% without condensation

Weight (Maximum)
- 3U Rack Unit: 8.0 kg (17.7 lb)
- 4U Rack Unit: 9.4 kg (20.7 lb)
- 5U Rack Unit: 11.4 kg (25.0 lb)

Terminal Connections
- Rear Screw-Terminal Tightening Torque, #8 Ring Lug
  - Minimum: 1.0 Nm (9 in-lb)
  - Maximum: 2.0 Nm (18 in-lb)
- User terminals and stranded copper wire should have a minimum temperature rating of 105°C. Ring terminals are recommended.

Wire Sizes and Insulation
- Wire sizes for grounding (earthing), current, voltage, and contact connections are dictated by the terminal blocks and expected load currents. You can use the following table as a guide in selecting wire sizes.
- The grounding conductor should be as short as possible and sized equal to or greater than any other conductor connected to the device, unless otherwise required by local or national wiring regulations.

<table>

Wire Sizes and Insulation
- Wire sizes for grounding (earthing), current, voltage, and contact connections are dictated by the terminal blocks and expected load currents. You can use the following table as a guide in selecting wire sizes.
- The grounding conductor should be as short as possible and sized equal to or greater than any other conductor connected to the device, unless otherwise required by local or national wiring regulations.

<table>
<thead>
<tr>
<th>Connection Type</th>

Type Tests

These tests do not apply to contacts rated for 24 Vdc.

Electromagnetic Compatibility (EMC)

Electromagnetic Compatibility Immunity

| Conducted RF Immunity: | IEC 60255-22-6:2001, 10 V rms |
| IEC 61000-4-6:2008, 10 V rms |

| Electrostatic Discharge Immunity: | IEEE C37.90.3-2001 |
| Levels 2, 4, 8 kV contact; |
| Levels 2, 4, 6, and 8 kV contact; |
| Levels 2, 4, 8, and 15 kV air |

| 4 kV at 5 kHz and 2 kV at 5 kHz |
| (Comm. Ports) |
| IEC 61000-4-4:2011 |
| 4 kV at 5 kHz |

Magnetic Field Immunity: IEC 61000-4-8:2009
100 A/m for 3 s
100 A/m for 1 min
IEC 61000-4-9:2001
100 A/m

IEC 61000-4-29:2000

10 V/m at 900 MHz and 1.89 GHz

Radiated Radio Frequency Immunity: IEC 60255-22-3:2007, 10 V/m
IEC 61000-4-3:2010, 10 V/m
IEEE C37.90.2-2004, 35 V/m

IEC 61000-4-5:2005
1 kV line-to-line, 2 kV line-to-earth

Damped Oscillatory Magnetic Field: IEC 60100-4-10:2001
Severity Level: 100 A/m

2.5 kV peak common mode
1.0 kV peak differential mode
IEEE C37.90.1-2002
2.5 kV oscillatory
4.0 kV fast transient

Environmental

| Cold: | IEC 60068-2-1:2007 |
| 16 hours at –40°C |

| Damp Heat, Cyclic: | IEC 60068-2-30:2005 |
| 25°C to 55°C, 6 cycles, 95% humidity |

| 16 hours at +85°C |

| Vibration: | IEC 60255-21-1:1988 |
| Severity Level: Class 2 (endurance); |
| Class 2 (response) |

| IEC 60255-21-2:1988 |
| Severity Level: Class 2 (shock withstand, bump); Class 2 (shock response) |

| IEC 60255-21-3:1993 |
| Severity Level: Class 2 (quake response) |

Safety

| Dielectric Strength: | IEC 60255-5-2000 |
| IEEE C37.90-2005 |
| 2500 Vac on contact inputs, contact outputs, and analog inputs |
| 3100 Vdc on power supply |

| Impulse: | IEC 60255-5-2000 |
| IEEE C37.90-2005 |
| 0.3 J, 5 kV |

| IP3X |

Reporting Functions

| High-Resolution Data Rate: | 8000 samples/second |
| 4000 samples/second |
| 2000 samples/second |
| 1000 samples/second |

| Output Format: | Binary COMTRADE |

Event Reports

| Length: | 0.25–24 seconds (based on LER and SRATE settings) |

| Volatile Memory: | 3 s of back-to-back event reports sampled at 8 kHz |

| Nonvolatile Memory: | At least 4 event reports of a 3 s duration sampled at 8 kHz |

| Resolution: | 8- or 4-samples/cycle |

Event Summary

| Storage: | 100 summaries |

Breaker History

| Storage: | 128 histories |

Sequential Events Recorder

| Storage: | 1000 entries |

| Trigger Elements: | 250 relay elements |

| Resolution: | 0.5 ms for contact inputs |

| Resolution: | 1/8 cycle for all elements |

Processing Specifications

| AC Voltage and Current Inputs | 8000 samples per second, 3 dB low-pass analog filter cut-off frequency of 3000 Hz. |

Digital Filtering

| Full-cycle cosine and half-cycle Fourier filters after low-pass analog and digital filtering. |

Protection and Control Processing

| Eight times per power system cycle |

Control Points

| 32 remote bits |
| 32 local control bits |
| 32 latch bits in protection logic |
| 32 latch bits in automation logic |
### Relay Element Pickup Ranges and Accuracies

#### Instantaneous/Definite-Time Overcurrent Elements

### Optional RTD Elements

#### (Models Compatible With SEL-2600 Series RTD Module)

12 RTD Inputs via SEL-2600 Series RTD Module and SEL-2800 Fiber-Optic Transceiver

Monitor Ambient or Other Temperatures

PT 100, NI 100, NI 120, and CU 10 RTD-Types Supported, Field Selectable

Pickup Range: Off, –50 to 250°C, 1°C step

Accuracy: ±2°C

As long as 500 m Fiber-Optic Cable to SEL-2600 Series RTD Module

### Breaker Failure Instantaneous Overcurrent

### Timer Specifications

#### Setting Ranges

- **Breaker Failure:** 0–6000 cycles, 0.125 cycle steps
  (All but BFIDO\textsubscript{n}, BFISP\textsubscript{n})
  0–1000 cycles, 0.125 cycle steps
  (BFIDO, BFISP)

- **Communications-Assisted Tripping Schemes:** 0.000–16000 cycles, 0.125 cycle steps

- **Pole Open Timer:** 0.000–60 cycles, 0.125 cycle steps

- **Recloser:** 1–999999 cycles, 1 cycle steps

- **Switch-Onto-Fault CLOEND, 52AEND:** OFF, 0.000–16000 cycles, 0.125 cycle steps

- **SOTFD:** 0.500–16000 cycles, 0.125 cycle steps

#### Synchronism-Check Timers

- **TCLSBK1, TCLSBK2:** 1.00–30.00 cycles, 0.25 cycle steps

### Station DC Battery System Monitor Specifications

#### Operating Range

- **DC Settings:** 15–300 Vdc, 1 Vdc steps
- **AC Ripple Setting:** 1–300 Vac, 1 Vac steps

#### Setting Range

- **Max. Operating Time:** ≤ 1.5 cycles
- **Pole Open Timer:** 0.000–60 cycles, 0.125 cycle steps

#### Station DC Battery System Monitor Specifications

- **Input Sampling Rate:** DC1: 2 kHz
  DC2: 1 kHz
- **Processing Rate:** 1/8 cycle
- **DC Settings:** 15–300 Vdc, 1 Vdc steps
- **AC Ripple Setting:** 1–300 Vac, 1 Vac steps
- **Accuracy:** ±3% plus ±2 Vdc (all elements but DC1RP and DC2RP)
  ±10% plus ±2 Vdc (DC1RP and DC2RP)

### Metering Accuracy

- All metering accuracy is at 20°C, and nominal frequency unless otherwise noted.

#### Currents

- **Phase Current Magnitude**
  - **5 A Model:** ±0.2% plus ±4 mA (2.5–15 A sec)
  - **1 A Model:** ±0.2% plus ±0.8 mA (0.5–3 A sec)

- **Sequence Currents Magnitude**
  - **5 A Model:** ±0.3% plus ±4 mA (2.5–15 A sec)
  - **1 A Model:** ±0.3% plus ±0.8 mA (0.5–3 A sec)

#### Voltages

- **300 V Maximum Inputs**
  - **Phase and Phase-to-Phase Voltage Magnitude:** ±2.5% ±1 V (5–33.5 V)
  - **Phase and Phase-to-Phase Angle:** ±1.0° (5–33.5 V)
  - **Sequence Voltage Magnitude (V1, V2, 3V0):** ±2.5% ±1 V (5–33.5 V)
  - **Sequence Voltage Angle (V1, V2, 3V0):** ±1.0° (5–33.5 V)

#### 8 V LEA Maximum Inputs

- **Phase and Phase-to-Phase**
  - Voltage Magnitude: ±0.3% (0.2–0.6 V)
  - Angle: ±0.1% (0.6–8.0 V)

- **Sequence Voltage Magnitude (V1, V2, 3V0):** ±0.3% (0.2–0.6 V)
  - Angle: ±0.1% (0.6–8.0 V)

### Frequency (40–65 Hz)

- **Accuracy:** ±0.01 Hz

#### Power

- **MW (P), Per Phase (Wye), 3φ (Wye or Delta) Per Terminal**
  - ±1% (0.1–1.2) • I\textsubscript{INOM} 33.5–300 Vac, PF = 1, 0.5 lead, lag (1φ)
  - ±0.7% (0.1–1.2) • I\textsubscript{INOM} 33.5–300 Vac, PF = 1, 0.5 lead, lag (3φ)
- **MVAr (Q), Per Phase (Wye), 3φ (Wye or Delta) Per Terminal**
  - ±1% (0.1–1.2) • I\textsubscript{INOM} 33.5–300 Vac, PF = 0, 0.5 lead, lag (1φ)
  - ±0.7% (0.1–1.2) • I\textsubscript{INOM} 33.5–300 Vac, PF = 0, 0.5 lead, lag (3φ)
- **MVA (S), Per Phase (Wye), 3φ (Wye or Delta) Per Terminal**
  - ±1% (0.1–1.2) • I\textsubscript{INOM} 33.5–300 Vac, PF = 1, 0.5 lead, lag (1φ)
  - ±0.7% (0.1–1.2) • I\textsubscript{INOM} 33.5–300 Vac, PF = 1, 0.5 lead, lag (3φ)
- **Percent PF, Per Phase (Wye), 3φ (Wye or Delta)**
  - ±1% (0.1–1.2) • I\textsubscript{INOM} 33.5–300 Vac, PF = 1, 0.5 lead, lag (1φ)
  - ±0.7% (0.1–1.2) • I\textsubscript{INOM} 33.5–300 Vac, PF = 1, 0.5 lead, lag (3φ)

#### Energy

- **MWh (P), Per Phase (Wye), 3φ (Wye or Delta)**
  - ±1% (0.1–1.2) • I\textsubscript{INOM} 33.5–300 Vac, PF = 1, 0.5 lead, lag (1φ)
  - ±0.7% (0.1–1.2) • I\textsubscript{INOM} 33.5–300 Vac, PF = 1, 0.5 lead, lag (3φ)
- **MVARh (Q), Per Phase (Wye), 3φ (Wye or Delta)**
  - ±1% (0.1–1.2) • I\textsubscript{INOM} 33.5–300 Vac, PF = 0, 0.5 lead, lag (1φ)
  - ±0.7% (0.1–1.2) • I\textsubscript{INOM} 33.5–300 Vac, PF = 0, 0.5 lead, lag (3φ)

#### Synchrophasors

- **Number of Synchrophasors for Each Stream:** 15
- **Total Vector Error (TVE) for Each Stream:** 0.5 Hz
- **Number of User Analogs for Each Stream:** 16
- **Number of User Digitals for Each Stream:** 64
- **Synchrophasor Protocol:** IEEE C37.118, SEL Fast Message (Legacy)
- **Synchrophasor Data Recording:** Records as much as 120 s
- **IEEE C37.232, File Naming Convention**
