Major Features and Benefits

The SEL-451-6 Sampled Values Protection, Automation, and Bay Control System integrates bay control for breakers and disconnect switches with full automation and protection in one device. The SEL-451-6 Sampled Values (SV) Subscriber subscribes to current and voltage SV (IEC 61850-9-2LE) information that is provided by remote merging units instead of standard potential transformer (PT) and current transformer (CT) inputs to reduce cable lengths, labor costs, and improve the overall safety of the substation.

➤ **Protection.** Customize distribution protection with multiple instantaneous and time-overcurrent elements with SELOGIC® control equations. Best Choice Ground Directional Element® logic optimizes directional element performance and eliminates the need for many directional settings. Provide comprehensive protection for two breakers with one relay.

➤ **Commissioning.** Rapidly commission your Bay Control with preconfigured bay arrangements. Choose among different bus configurations, including single- and dual-busbar, transfer bus, tie breaker, breaker-and-a-half, ring-bus, double-bus/double-breaker, and source transfer configurations. These bus arrangements allow easy status and control of as many as 20 disconnect switches and two breakers. Additional user-selectable bay types are available via ACSELERATOR QuickSet® SEL-5030 Software that can be downloaded at selinc.com.

➤ **Automation.** Take advantage of enhanced automation features that include 32 programmable elements for local control, remote control, protection latching, and automation latching. Local metering on the large format front-panel LCD eliminates the need for separate panel meters. Serial and Ethernet links efficiently transmit key information, including metering data, protection element and control input/output (I/O) status, IEEE C37.118 Synchrophasors, IEC 61850 GOOSE messages, Sequential Events Recorder (SER) reports, breaker monitor, relay summary event reports, and time synchronization. Apply expanded SELOGIC control equations with math and comparison functions in control applications. Incorporate as many as 1000 lines of automation logic to speed and improve control actions.
Software-Invertible Polarities. Invert individual or grouped CT and PT polarities to account for field wiring or zones of protection changes. CEV files and all metering and protection logic use the inverted polarities, whereas COMTRADE event reports do not use inverted polarities but rather record signals as applied to the relay.

Synchrophasors. Make informed load dispatch decisions based on actual real-time phasor measurements from SEL-451 relays across your power system. Record streaming synchrophasor data from SEL-451 relays for system-wide disturbance recording. Control the power system using local and remote synchrophasor data.

High-Impedance Fault Detection. The optional high-impedance fault (HIF) detection element operates for small current ground faults typically caused by downed conductors on surfaces such as earth, concrete or other poorly conductive materials. HIF event data are made available in standard COMTRADE format.

Ethernet Access. Access all relay functions with the Ethernet card. Interconnect with automation systems using IEC 61850 Edition 2 or DNP3 protocol directly. Use file transfer protocol (FTP) for high-speed data collection. Connect to substation or corporate LANs to transmit synchrophasors in the IEEE C37.118–2005 format using TCP or UDP Internet protocols.

Parallel Redundancy Protocol (PRP). Provide seamless recovery from any single Ethernet network failure, in accordance with IEC 62439-3:2010. The station bus Ethernet network and traffic are fully duplicated with both copies operating in parallel.

Digital Relay-to-Relay Communications. Enhanced MIRRORED BITS® communications can monitor internal element conditions between bays within a station, or between stations, using SEL fiber-optic transceivers. Send digital, analog, and virtual terminal data over the same MIRRORED BITS channel.

Monitoring. Schedule breaker maintenance when accumulated breaker duty (independently monitored for each pole of two circuit breakers) indicates possible excess contact wear. Electrical and mechanical operating times are recorded for both the last operation and the average of operations since function reset. Two independent DC monitors provide notification of substation battery voltage problems even if voltage is low only during trip or close operations.

Breaker Failure. High-speed (less than one cycle) open-pole detection logic reduces coordination times for critical breaker failure applications. Apply the SEL-451 to supply breaker failure protection for one or two breakers. Logic for breaker failure retrip and initiation of transfer tripping is included.

Sequential Events Recorder (SER). Record the last 1000 events, including setting changes, power-ups, and selectable logic elements.

IEC 61850-9-2LE SV Relay. Subscribes to current and voltage information that is published by remote merging units instead of standard PT and CT inputs to reduce cable lengths, labor costs, and improve the overall safety of the substation.

IEC 61850 Operating Modes. The relay supports IEC 61850 standard operating modes such as Test, Blocked, On, and Off.

Current Summation. The relay can combine multiple SV Stream currents to simplify external wiring.

Dual CT Input. Apply with ring-bus, breaker-and-a-half, or other two-breaker schemes. Combine currents within the relay from two sets of CTs via SV subscription for protection functions, but keep them separately available for monitoring and station integration applications.

Comprehensive Metering. Improve feeder loading by using built-in, high-accuracy metering functions. Watt and VAR measurements optimize feeder operation. Minimize equipment needs with full metering capabilities including rms, maximum/minimum, demand/peak, energy, and instantaneous values.

High-Accuracy Time-Stamping. Time-tag binary COMTRADE event reports with real-time accuracy of better than 10 µs. View system state information to an accuracy of better than 1/4 of an electrical degree.

Oscillography and Event Reporting. Record voltages, currents, and internal logic points at up to 8 kHz sampling rate. Off line phasor and harmonic analysis features allow investigation of bay and system performance.

Reclosing. Incorporate programmable reclosing of one or two breakers into an integrated substation control system. Synchronism and voltage checks from multiple sources provide complete bay control.

Fault Locator. Efficiently dispatch line crews to quickly isolate line problems and restore service faster.

IEC 60255-Compliant Thermal Model. Use the relay to provide a configurable thermal model for the protection of a wide variety of devices.
➤ **Rules-Based Settings Editor.** Communicate with and set the relay using an ASCII terminal, or use the PC-based QuickSet software to configure the SEL-451 and analyze fault records with relay element response.

➤ **Auxiliary Trip/Close Pushbuttons.** These optional pushbuttons are electrically isolated from the rest of the relay. They function independently from the relay and do not need relay power.

➤ **Low-Energy Analog (LEA) Inputs.** Reduce costs and save space with as many as six IEEE C37.92-compliant LEA voltage inputs.

### Functional Overview

The SEL-451-6 Relay subscribes to IEC 61850-9-2LE data streams that are published by merging units, such as the SEL-421-7 Protection, Automation, and Control System With Sampled Values or SEL-401 Protection, Automation, and Control Merging Unit. The SEL-421-7 provides full backup protection while the SEL-401 merging unit can provide basic directional overcurrent and breaker failure protection in the absence of communication. Using the process bus, the SEL-421-7 SV Publisher or SEL-401 can provide voltage and current information to multiple relays that subscribe to SV. The data may be synchronized via IRIG-B time input or IEEE 1588-2008 PTP.
Protection Features

Software-Invertible Polarieties
Save Commissioning Time and Costs

The SEL-451 provides software-invertible CT and PT polarities. You can invert individual phase CT and PT inputs to account for field wiring or invert whole CT terminals to change a relay zone of protection without having to change field wiring. All signal processing uses the software-inverted polarities for CEV file generation, metering, and protection logic. COMTRADE file generation is isolated from the impacts of the inverted polarities, and records signals as applied to the relay terminals.

Directional Elements Increase Sensitivity and Security

The SEL-451 provides multiple directional elements to optimize security and sensitivity. Use ground and negative-sequence directional overcurrent elements to detect high-resistance faults when using communications-assisted tripping schemes.

The SEL-451 includes a number of directional elements for supervision of overcurrent elements. The negative-sequence directional element uses the same patented principle proven in SEL-351 Relays. This directional element can be applied in virtually any application, regardless of the amount of negative-sequence voltage available at the relay location.

Ground overcurrent elements are directionally controlled by three directional elements working together:
- Negative-sequence voltage-polarized directional element
- Zero-sequence voltage-polarized directional element
- Zero-sequence current-polarized directional element

Our patented Best Choice Ground Directional Element selects the best ground directional element for the system conditions and simplifies directional element settings (you can override this automatic setting feature for special applications).

Communications-Assisted Tripping Schemes

Use communications to improve tripping time for better customer service. The SEL-451 is the ideal relay for use in pilot-based tripping schemes. Enhanced MIRRORED BITS communications with SEL fiber-optic transceivers provide 3–6 ms relay-to-relay transmission time. Among the schemes supported are the following:

- Permissive Overreaching Transfer Tripping (POTT)
- Directional Comparison Unblocking (DCUB)
- Directional Comparison Blocking (DCB)

Use the SELOGIC control equation TRCOMM to program specific elements, combinations of elements, inputs, etc., to perform communications scheme tripping and other scheme functions. The logic readily accommodates the following conditions:
- Current reversals
- Breaker open at one terminal
- Weak-infeed conditions at one terminal
- Switch-onto-fault conditions

Overcurrent Elements

The SEL-451 includes four phase, four negative-sequence, and four ground instantaneous overcurrent elements. The SEL-451 also includes six selectable operating quantity inverse-time overcurrent elements. You can select the operating quantities from the following:

IA, IB, IC, MAX(IA, IB, IC), I1, 3I2, IG

where IA, IB, IC can be fundamental or rms quantities from either circuit breaker or combined currents.

The time-overcurrent curves (listed in Table 1) have two reset characteristic choices for each time-overcurrent element. One choice resets the elements if current drops below pickup for one cycle. The other choice emulates the reset characteristic of an electromechanical induction disc relay.

Breaker Failure Protection

Incorporated into the SEL-451 is a full function breaker failure system. Current can be individually monitored in two breakers. High-speed open-pole detection logic allows you to set the pickup current below minimum load for sensitivity without sacrificing high-speed dropout.
Even in cases with delayed current zero in the secondary of the CT caused by trapped flux, high-speed detection of circuit breaker opening is achieved. This feature is essential if breaker failure is initiated on all circuit breaker trips. A reset of less than one cycle reduces coordination times, improving stability.

**Thermal Overload Protection**

The SEL-451 supports three independent thermal elements that conform to the IEC 60255-149 standard. Use these elements to activate a control action or issue an alarm or trip when your equipment overheats as a result of adverse operating conditions. The SEL-2600 RTD Module provides ambient temperature measurements for the thermal model.

**Loss-of-Potential (LOP) Logic Supervises Directional Elements**

The SEL-451 includes logic to detect an LOP caused by failures such as blown fuses, which can cause an incorrect operation in directional elements. Simple settings configure the LOP logic to either block or force forward ground and phase directional elements under these conditions. The logic checks for a sudden change in positive-sequence voltage without a corresponding change in positive- or zero-sequence current. Tests and field experience show that this principle is very secure and is faster than the tripping elements.

**HIF Detection**

HIF are short-circuit faults with fault currents smaller than what a traditional overcurrent protective relay can detect. The SEL-451 includes logic used to detect HIF signatures without being affected by loads and other system operation conditions. A running average provides a stable prefault reference and adaptive tuning learns and tunes out feeder ambient noise conditions. Decision logic differentiates an HIF condition from other system conditions such as switching operations and noisy loads. As much as 40 minutes of HIF activity is stored in high-resolution COMTRADE format and a summary of HIF activity is available using ASCII commands. View important HIF data from available metering commands.

**Six Independent Settings Groups Increase Operation Flexibility**

The relay stores six settings groups. Select the active settings group by control input, command, or other programmable conditions. Use these settings groups to cover a wide range of control contingencies. Selectable settings groups make the SEL-451 ideal for applications requiring frequent settings changes and for adapting the bay to changing system conditions.

Selecting a group also selects logic settings. Program group logic to adjust settings for different operating conditions, such as station maintenance, seasonal operations, emergency contingencies, loading, source changes, and adjacent relay settings changes.

**Combined Current for Protection Flexibility**

In traditional relays, when protecting a line fed from two breakers, such as a breaker-and-a-half system or double-breaker system, you needed to combine the CT inputs before connecting these inputs to the relay. The SEL-451 can accept separate inputs from two separate CTs and mathematically combine the currents. This allows collecting separate current metering and breaker monitor information for each breaker. Breaker monitoring functions for two breakers are done within one relay. Individual breaker currents allow for breaker failure functions on a per-breaker basis within the SEL-451. Breaker diagnostics are reported on a comparative basis allowing for advanced, proactive troubleshooting.

**Custom Control Capabilities**

Customize control capabilities, adding stability and security to your system.

- Use expanded SELOGIC control equations to create advanced stability enhancements such as VAR-flow controlled time undervoltage load shedding.

- Combine frequency elements with voltage supervision for added security with underfrequency load-shedding systems.
Control Inputs and Outputs

Select one interface board with a variety of contact input and output configurations, including:

- Optoisolated, level-sensitive contact inputs
- High-current interrupting contact outputs
- High-speed, high-current interrupting contact outputs

The relay is available in 4U chassis height. The 4U chassis requires the selection of one expansion I/O board. Assign the control inputs for disconnect auxiliary contact status and breaker auxiliary contact status. Set the input debounce time independently for each input or as a group. Each control output is programmable using SELOGIC control equations.

Multifunction Reclosing With Flexible Applications

The SEL-451 includes three-pole trip and reclose functions, for either one or two breakers (Figure 3). Synchronization check is included for breaker control. Synchronizing and polarizing voltage inputs are fully programmable with Dead Line/Dead Bus closing logic as well as zero-closing-angle logic to minimize system stress upon reclosing. Program as many as four reclose attempts. Select Leader and Follower breakers directly, or use a SELOGIC control equation to determine reclosing order based on system conditions.

Two-Breaker Control

The SEL-451 contains analog voltage inputs for multiple sources and control inputs to indicate both breaker and disconnect position, as well as the logic required to provide full control for two breakers. This includes separate monitoring functions as well as separate elements for tripping and closing the two breakers to allow for leader/follower operation or other desired control schemes. All analog values are monitored on a per-breaker basis to allow station control access to complete information for individual components of the system.
Bay Control

The SEL-451 Bay Control provides dynamic bay one-line diagrams on the front-panel screen with disconnect and breaker control capabilities for numerous predefined user-selectable bay types. Additional user-selectable bay types are available via an QuickSet interface that can be downloaded at www.selinc.com. The bay control is equipped to control as many as 20 disconnects and two breakers, depending on the one-line diagram selected. Certain one-line diagrams provide status for as many as three breakers and ten disconnect switches. Operate disconnects and breakers with ASCII commands, SELOGIC control equations, Fast Operate Messages, and from the one-line diagram. The one-line diagram includes user-configurable apparatus labels and as many as 24 user-definable analog quantities.

One-Line Bay Diagrams

The SEL-451 offers a variety of preconfigured one-line diagrams for common bus configurations. Once a one-line diagram is selected, the user has the ability to customize the names for all of the breakers, disconnect switches, and buses. Most one-line diagrams contain analog display points. These display points can be set to any of the available analog quantities with labels, units, and scaling. These values are updated real-time along with the breakers and switch position to give instant status and complete control of a bay. The diagrams below demonstrate some of the preconfigured bay arrangements available in the SEL-451.

The operator can see all valuable information on a bay before making a critical control decision. Programmable interlocks help prevent operators from incorrectly opening or closing switches or breakers. The SEL-451 will not only prevent the operator from making an incorrect control decision, but can notify and/or alarm when an incorrect operation is initiated.

Figure 4  Breaker-and-a-Half

Figure 5  Ring Bus With Ground Switch
Circuit Breaker Operations From the Front Panel

Figure 4 through Figure 7 are examples of some of the many selectable one-line diagrams in the SEL-451. The one-line diagram is selectable from the Bay settings. Additional settings for defining labels and analog quantities are also found in the Bay settings. One-line diagrams are composed of the following:

- Bay Names and Bay Labels (Bay Labels available in one-line diagrams 14, 17, 18, and 23. All other one-line diagrams use the Bay Name.)
- Busbar and Busbar Labels
- Breaker and Breaker Labels
- Disconnect Switches and Disconnect Switch Labels
- Analog Display Points

Figure 8 shows the Breaker Control Screens available when the ENT pushbutton is pressed with the circuit breaker highlighted as shown in Figure 8 (a). After pressing the ENT pushbutton with the breaker highlighted and the LOCAL Relay Word bit asserted, the Breaker Control Screen in Figure 8 (b) is displayed. After entering the screen in Figure 8 (b), the relay performs the circuit breaker operations as outlined in the SEL-451-6 Instruction Manual. If the LOCAL Relay Word bit is not asserted when the ENT pushbutton is pressed, the screen in Figure 8 (c) is displayed for three seconds, then the bay control again displays the screen in Figure 8 (a).
Rack-Type Breakers Mosaics

The SEL-451 supports the display of rack-type (also referred to as truck-type) circuit breakers. The rack-type breakers have three positions: racked out, test, and racked in. When in the test or racked-in positions, the breaker can be displayed as open or closed. When racked out, there is no breaker open/close display. The rack-type breakers are a display-only functionality and do not impact any circuit breaker control capabilities.

Status-Only Disconnects

The SEL-451 has the ability to designate a disconnect as having control functionality or being status-only. When a disconnect is designated as having control functionality, the disconnect can be selected and controlled from the relay front-panel HMI. When a disconnect is designated as status-only, the disconnect is displayed in the one-line diagram of the relay front-panel HMI, but it is not selectable when navigating the front-panel HMI. Three-position disconnects are also supported with control/display functionality on a per position basis.

Rules-Based Settings Editor

QuickSet develops settings on- or offline. The system automatically checks interrelated settings and highlights out-of-range settings. Settings are transferred by using a PC communications link with the SEL-451. The QuickSet interface supports Server 2008, Windows 7 and Windows 8 operating systems, and can be used to open COMTRADE files from SEL and other products. Convert binary COMTRADE files to ASCII format for portability and ease of use. View real-time phasors and harmonic values.

QuickSet Bay Control Settings Interface

There are two ways to enter Bay Control settings by using the QuickSet settings interface. The standard style settings are displayed in traditional form under the Bay Control form. QuickSet also provides an interactive bay control setting entry method. The interactive method works by clicking on the one-line diagram labels. This action automatically displays all the settings for the...
device selected. This method provides an easy way of organizing and verifying all settings associated with the device.

*Figure 9* illustrates the interactive bay control setting form in QuickSet. Click on an apparatus in the one-line diagram, and a form with apparatus-specific settings is displayed.

**QuickSet Templates**

Use the fully licensed version of QuickSet to create custom views of settings, called Application Designs, to reduce complexity, decrease the chance of errors, and increase productivity, including the following:

- Lock and hide unused settings.
- Lock settings to match your standard for protection, I/O assignment, communications, and SELogIC control equations.
- Enforce settings limits narrower than the device settings.
- Define input variables based on the equipment nameplate or manufacturer’s terminology or scaling and calculate settings from these “friendlier” inputs.
- Use settings comments to guide users and explain design reasoning.

![Interactive Bay Control Setting Form](image-url)
Front-Panel Display

The LCD shows event, metering, settings, and relay self-test status information. The target LEDs display relay target information as shown in Figure 10.

Status and Trip Target LEDs

The SEL-451 includes programmable target LEDs, as well as programmable direct-action control pushbuttons/LEDs on the front panel. These LEDs and pushbuttons are shown in Figure 10.

The SEL-451 features a versatile front panel that you can customize to fit your needs. Use SELOGIC control equations and slide-in configurable front-panel labels to change the function and identification of target LEDs and operator control pushbuttons and LEDs. The blank slide-in label set is included with the SEL-451. Label sets can be printed from a laser printer by using templates supplied with the relay or hand labeled on supplied blank labels.

Advanced Display Points

Create custom screens showing metering values, special text messages, or a mix of analog and status information with programmable display points. Figure 12 shows an example of how display points can be used to show circuit breaker information and current metering. As many as 96 display points can be created. All display points occupy one, and only one, line on the display at all times. The height of the line is programmable as either single or double as shown in Figure 12. These screens become part of the autoscrolling display when the front panel times out.

Alarm Points

You can display messages on the SEL-451 front-panel LCD that indicate alarm conditions in the power system. The relay uses alarm points to place these messages on the LCD.

Figure 13 shows a sample alarm points screen. The relay is capable of displaying as many as 66 alarm points. The relay automatically displays new alarm points while in manual-scrolling mode and in autoscrolling mode. The alarm point messages are assigned using SER Points settings. The asterisk next to the alarm point indicates an active alarm. The inactive alarms can be acknowledged and cleared using the front-panel navigation buttons.
Monitoring and Metering

Complete Metering Capabilities

The SEL-451 provides extensive metering capabilities as listed in Table 2.

Event Reporting and SER

Event Reports and SER features simplify post-fault analysis and help improve your understanding of both simple and complex protective scheme operations. These features also aid in testing and troubleshooting bay settings and control schemes. Oscillograms are available in binary COMTRADE and ASCII COMTRADE formats.

Oscillography and Event Reporting

In response to a user-selected internal or external trigger, the voltage, current, and element status information contained in each event report confirms relay, scheme, and system performance for every fault. Decide how much detail is necessary when an event report is triggered: 8 kHz, 4 kHz, 2 kHz, or 1 kHz resolution analog data. The relay stores from 24 seconds of data per fault at 1 kHz resolution to 3 seconds per fault at 8 kHz resolution. Reports are stored in nonvolatile memory. Settings operational in the relay at the time of the event are appended to each event report.

Event Summary

Each time the SEL-451 generates a standard event report, it also generates a corresponding Event Summary. This is a concise description of an event that includes bay/terminal identification, event date and time, fault location, phase voltages, fault type at time of trip, and trip and close times of day.

With an appropriate setting, the relay will automatically send an Event Summary in ASCII text to one or more relay communications ports each time an event report is triggered.

SER

Use this feature to gain a broad perspective of relay element operation. Items that trigger an SER entry are selectable and can include input/output change of state, element pickup/dropout, recloser state changes, etc. The relay SER stores the latest 1,000 entries.

Voltage Sag, Swell, Interruption Records

The SEL-451 can perform automatic voltage disturbance monitoring for three-phase systems. The voltage sag/swell/interruption (VSSI) recorder uses the VSSI Relay Word bits to determine when to start (trigger) and when to stop recording. The VSSI recorder uses nonvolatile memory, so de-energizing the relay will not erase any stored VSSI data.

The recorded data are available through the VSSI report, which includes date, time, current, voltage, and voltage sag/swell/interruption (VSSI) element status during voltage disturbances, as determined by programmable settings VINT, VSAG, and VSWELL. When the relay is recording a disturbance, entries are automatically added to the VSSI report at one of four rates, depending on the length of the disturbance:

- Once per quarter cycle
- Once per cycle
- Once per 64 cycles
- Once per day

High-Accuracy Time Keeping

Using a combination of IRIG-B and a global positioning satellite, the SEL-451 can time-tag oscillography to within 10 µs accuracy. This high accuracy can be combined with the high sampling rate of the relay to synchronize data from across the system with an accuracy of better than 1/4 electrical degree. This allows examination
of the power system state at given times, including load angles, system swings, and other system-wide events. Triggering can be via external signal (contact or communications port), set time, or system event. Optimal calibration of this feature requires a knowledge of primary input component (VT and CT) phase delay and error.

A single IRIG-B time-code input synchronizes the SEL-451 time to within ±1 ms of the time-source input. A convenient source for this time code is the SEL-2032 Communications Processor (via Serial Port 1 on the SEL-451).

PTP Time Synchronization

In addition to IRIG-B, the relay can be time-synchronized through the Ethernet network by using IEEE 1588 Precision Time Protocol, version 2 (PTPv2). When connected directly to a grandmaster clock providing PTP at 1-second sync intervals, the relay can be synchronized to an accuracy of ±100 ns. The relay is capable of receiving as many as 32 sync messages per second.

SNTP Time Synchronization

Use SNTP to cost-effectively synchronize SEL-451 Relays equipped with Ethernet communication to as little as ±1 ms over standard Ethernet networks without any time-source delay. Use SNTP as a primary time source, or as a backup to a higher accuracy IRIG-B time input to the relay.

Substation Battery Monitor for DC Quality Assurance

The SEL-451 measures and reports the substation battery voltage for two battery systems. Two sets of programmable threshold comparators and associated logic provide alarm and control of two separate batteries and chargers. The relay also provides dual ground detection. Monitor dc system status alarms with an SEL communications processor and trigger messages, telephone calls, or other actions.

The measured dc voltage is reported in the METER display via serial port communications, on the LCD, and in the event report. Use the event report data to see an oscillographic display of the battery voltage. Monitor the substation battery voltage drops during trip, close, and other control operations.
Breaker Monitor Feature Allows for Wear-Based Breaker Maintenance Scheduling

Circuit breakers experience mechanical and electrical wear at each operation. Effective scheduling of breaker maintenance takes into account the manufacturer’s published data of contact wear versus interruption levels and operation count. The SEL-451 dual breaker monitor feature compares the breaker manufacturer’s published data to the integrated actual interrupted current and number of operations.

- Every time the breaker trips, the relay integrates interrupted current. When the result of this integration exceeds the threshold set by the breaker wear curve (Figure 16), the bay can alarm via an output contact or the optional front-panel display. With this information, you can schedule breaker maintenance in a timely, economical fashion.

Figure 16  Breaker Contact Wear Curve and Settings

The relay monitors last and average mechanical and electrical interruption time. You can easily determine if operating time is increasing beyond reasonable tolerance to schedule proactive breaker maintenance. You can activate an alarm point if operation time goes beyond a preset value.

Breaker motor run time and breaker inactivity are also monitored.
Automation

Flexible Control Logic and Integration Features

The SEL-451 control logic can be used to perform the following:

- Replace traditional panel control switches
- Eliminate remote terminal unit (RTU)-to-bay wiring
- Replace traditional latching relays
- Replace traditional indicating panel lights

Eliminate traditional panel control switches with 32 local control points. Set, clear, or pulse local control points with the front-panel pushbuttons and display. Program the local control points to implement your control scheme via SELOGIC control equations. Use the local control points for such functions as trip testing, enabling/disabling reclosing, and tripping/closing circuit breakers.

Eliminate RTU-to-bay wiring with 32 remote control points. Set, clear, or pulse remote control points via serial port commands. Incorporate the remote control points into your control scheme via SELOGIC control equations. Use remote control points for SCADA-type control operations (e.g., trip, close, settings group selection).

Replace traditional latching relays for such functions as “remote control enable” with 32 latching control points. Program latch set and latch reset conditions with SELOGIC control equations. Set or reset the latch control points via control inputs, remote control points, local control points, or any programmable logic condition. The latch control points retain states when the relay loses power.

Replace traditional indicating panel lights and switches with as many as 24 latching target LEDs and as many as 12 programmable pushbuttons with LEDs. Define custom messages (i.e., BREAKER OPEN, BREAKER CLOSED, RECLOSER ENABLED) to report power system or relay conditions on the large format LCD. Control which messages are displayed via SELOGIC control equations by driving the LCD display via any logic point in the relay.

Open Communications Protocols

The SEL-451 does not require special communications software. ASCII terminals, printing terminals, or a computer supplied with terminal emulation and a serial communications port are all that is required. Table 3 lists a brief description of the terminal protocols.

Table 3 Open Communications Protocol

SELogic Control Equations With Expanded Capabilities and Aliases

Expanded SELogic control equations put relay logic in the hands of the engineer. Assign inputs to suit your application, logically combine selected bay elements for various control functions, and assign outputs to your logic functions.

Programming SELogic control equations consists of combining relay elements, inputs, and outputs with SELogic control equation operators (Table 4). Any element in the Relay Word bit can be used in these equations. For complex or unique applications, these expanded SELogic functions allow superior flexibility.

Use the relay alias capability to assign more meaningful names to analog and Boolean quantities. This improves the readability of customized programming. Use as many as 200 aliases to rename any digital or analog quantity. The following is an example of possible applications of SELogic control equations that use aliases.

```
>> SET T <Enter>
1: PMV01, THETA
   (assign the alias “THETA” to math variable PMV01)
2: PMV02, TAN
   (assign the alias “TAN” to math variable PMV02)
>> SET L <Enter>
1: # CALCULATE THE TANGENT OF THETA
   TAN := SIN(THETA)/COS(THETA)
2: # (use the aliases in an equation)
```

Add programmable control functions to your relay and automation systems. New functions and capabilities enable using analog values in conditional logic statements. The following are examples of possible applications of SELogic control equations with expanded capabilities.

- Interlock breakers and disconnect switches.
- Restrict breaker tripping in excessive duty situations without additional relays.
- Construct a compensated overvoltage element for open line overvoltage protection.
- Hold momentary change-of-state conditions for SCADA polling.
- Provide a combination of frequency or rate-of-change-of-frequency functions.

![Figure 17 Motor-Driven Reclose Timer](image)

Relay-to-Relay Digital Communications (Mirrored Bits)

The SEL patented Mirrored Bits technology provides bidirectional relay-to-relay digital communication (Figure 17). In the SEL-451, Mirrored Bits can operate simultaneously on any two serial ports for three-terminal power system operation.

This bidirectional digital communication creates additional outputs (transmitted Mirrored Bits) and additional inputs (received Mirrored Bits) for each serial port operating in the Mirrored Bits communications mode. Communicated information can include digital, analog, and virtual terminal data. Virtual terminal allows operator access to remote bays through the local network.

> Interlock breakers and disconnect switches.
> Restrict breaker tripping in excessive duty situations without additional relays.
> Construct a compensated overvoltage element for open line overvoltage protection.
> Hold momentary change-of-state conditions for SCADA polling.
> Provide a combination of frequency or rate-of-change-of-frequency functions.

> Emulate a motor-driven reclose timer, including stall, reset, and drive-to-lockout conditions (refer to Figure 17).
> Scale analog values for SCADA retrieval.
> Initiate remedial action sequence based on load flow before fault conditions.
bay. These MIRRORED BITS can be used to transfer information between line terminals to enhance coordination and achieve faster tripping. MIRRORED BITS also help reduce total pilot scheme operating time by eliminating the need to close output contacts and debounce contact outputs. Use the dual-port MIRRORED BITS communications capabilities for high-speed communications-assisted schemes applied to three-terminal transmission lines.

Serial Communication

The SEL-451 offers the following serial communication features.

- Four independent EIA-232 serial ports.
- Full access to event history, relay status, and meter information.

Network Connection and Integration

Ethernet Communication

The Ethernet card mounts directly in the SEL-451-6. The Ethernet card provided PTP for data time synchronization. Use popular Telnet applications for easy terminal communications with SEL relays and other devices. Transfer data at high speeds (10 Mbps or 100 Mbps) for fast HMI updates and file uploads. The Ethernet card communicates using FTP applications for easy and fast file transfers. The Ethernet card provides four Ethernet ports. Two ports are for station bus and two ports are for process bus.

Provide operations with situational awareness of the power system by using IEEE C37.118-2005 Standard for Synchrophasors for Power Systems. Communicate with SCADA and other substation intelligent electronic devices (IEDs) by using DNP3 or IEC 61850 logical nodes and GOOSE messaging.

Choose Ethernet connection media options for primary and standby connections:

- 10/100BASE-T Twisted Pair Network
- 100BASE FX Fiber-Optic Network

Telnet and FTP

The SEL-451 is equipped with an Ethernet communications card that supports Telnet and FTP communications. Use Telnet to access relay settings, and metering and event reports remotely using the ASCII interface. Transfer settings files to and from the relay via the high-speed Ethernet port through use of FTP.

IEEE C37.118 Synchrophasors

The latest IEEE synchrophasor protocol provides a standard method for communicating synchronized phasor measurement data over Ethernet or serial media. The integrated Ethernet card in the SEL-451 provides two independent connections by using either TCP/IP, UDP/IP, or a combination thereof. Each connection supports unicast or multicast options for serving data to one or multiple clients simultaneously. Each data stream can support data streams at as fast as 60 frames per second.

DNP3 LAN/WAN

DNP3 LAN/WAN provides the SEL-451-6 with DNP3 Level 2 Outstation functionality over Ethernet. Custom DNP3 data maps can be configured for use with specific DNP3 masters.

PTP

An Ethernet card option with Ports 5A and 5B populated provides the ability to accept PTPv2 for data time synchronization. Optional PTP support includes both the Default and Power System (IEEE C37.238-2011) PTP Profiles.

PRP

This protocol is used to provide seamless recovery from any single Ethernet network failure, in accordance with IEC 62439-3:2010. The Ethernet network traffic is fully duplicated with both copies operating in parallel, with the exception of SV.
HTTP Web Server

The relay can serve read-only webpages displaying certain settings, metering, and status reports. As many as four users can access the embedded HTTP server simultaneously.

![Typical Web Server Default Menu Screen](image)

**IEC 61850-9-2LE SV**

The SEL-451-6 supports IEC 61850-9-2 SV according to the 61850-9-2LE implementation guideline. The SEL-451-6 SV Subscriber is able to subscribe to as many as seven SV streams from any source that conforms to the IEC 61850-9-2LE guideline. Self-monitoring of the Ethernet links validates the data quality and reduces the need for periodic testing of the communication network.

**IEC 61850 Edition 2 Ethernet Communications**

IEC 61850 Edition 2 Ethernet-based communications provide interoperability among IEDs within the substation. Logical nodes using IEC 61850 allow standardized interconnection of IEDs from different manufacturers for monitoring and control of the substation. Reduce wiring among various manufacturers’ devices and simplify operating logic with IEC 61850. Eliminate system RTUs by streaming monitoring and control information from IEDs directly to remote SCADA client devices.

The SEL-451 can be ordered with embedded IEC 61850 Edition 2 protocol operating on 100 Mbps Ethernet. Use the IEC 61850 Edition 2 Ethernet protocol for relay monitoring and control functions, including the following:

- As many as 128 incoming GOOSE messages. The incoming GOOSE messages can be used to control as many as 256 control bits and 256 analog quantities in the relay with <3 ms latency from device to device. These messages provide binary control inputs to the relay for high-speed control functions and monitoring.
- As many as eight outgoing GOOSE messages. Outgoing GOOSE messages can be configured for Boolean and/or analog data. Boolean data are provided with <3 ms latency from device to device. Use outgoing GOOSE messages for high-speed control and monitoring of external breakers, switches, and other devices.
- IEC 61850 Edition 2 Data Server. The SEL-451 is equipped with embedded IEC 61850 Ethernet protocol that provides data according to pre-defined logical node objects. As many as seven simultaneous client associations are supported by
each relay. Relevant Relay Word bits are available within the logical node data, so status of relay elements, inputs, outputs, or SELOGIC control equations can be monitored using the IEC 61850 data server provided in the relay.

MMS File Services

This service of IEC 61850 Manufacturing Message Specification (MMS) provides support for file transfers completely within an MMS session. All relay files that can be transferred via FTP can also be transferred via MMS file services.

MMS Authentication

When enabled via a setting in the Configured IED Description (CID) file, the relay will require authentication from any client requesting to initiate an MMS session. The client request must be accompanied by the Access Level 2 password.

Architect

Use ACSELERATOR Architect® SEL-5032 Software to manage the logical node data for all IEC 68150 devices on the network. This Windows-based software provides easy-to-use displays for identifying and binding IEC 61850 network data between logical nodes by using IEC 61850-compliant CID files. Architect uses CID files to describe the data the IEC 61850 logical node provides within each relay.

Front- and Rear-Panel Diagrams

Figure 2.5  SEL-451 SV Subscriber Relay, Rear Panel

Relay Dimensions

Figure 3  SEL-451-6 Dimensions for Rack- and Panel-Mount Models
Specifications

Note: The SEL-451 SV Subscriber Relay uses a SV-based remote data acquisition system. Operating times will be delayed by the configured channel delay, CH_DLY. Use caution when setting the relay coordination times to account for this added delay. See SV Network Delays in Section 17 in the SEL-400 Series Relays Instruction Manual for more details on this setting.

Note: The metering and protection element accuracies specified for the SEL-451 SV Subscriber Relay are valid only when using SEL SV publisher relays. Third-party SV publisher devices are supported, but hardware accuracies and analog filtering need to be considered to determine the effect on SEL-451 performance.

Compliance

Designed and manufactured under an ISO 9001 certified quality management system

47 CFR 15B Class A

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference in which case the user will be required to correct the interference at his own expense.

Control Inputs
Optoisolated (For Use With AC or DC Signals)

- INT2 Interface Board: 8 inputs with no shared terminals (2 groups of 9 inputs with each group sharing one terminal)
- INT4 Interface Board: 6 inputs with no shared terminals
- 18 inputs with shared terminals

Voltage Options: 24, 48, 110, 125, 220, 250 V
Current Draw: <5 mA at nominal voltage
Current Draw: <8 mA for 110 V option
Sampling Rate: 2 kHz

DC Thresholds (Dropout thresholds indicate level-sensitive option)
- 24 Vdc: Pickup 19.2–30.0 Vdc; Dropout <28.8 Vdc
- 48 Vdc: Pickup 38.4–60.0 Vdc; Dropout <28.8 Vdc
- 110 Vdc: Pickup 88.0–132.0 Vdc; Dropout <66.0 Vdc
- 125 Vdc: Pickup 105–150 Vdc; Dropout <75 Vdc
- 220 Vdc: Pickup 176–264 Vdc; Dropout <132 Vdc
- 250 Vdc: Pickup 200–300 Vdc; Dropout <150 Vdc

AC Thresholds (Ratings met only when recommended control input settings are used)
- 24 Vdc: Pickup 16.4–30.0 Vdc
- 48 Vac: Pickup 32.8–60.0 Vac rms; Dropout <20.3 Vac rms
- 110 Vac: Pickup 75.1–132.0 Vac rms; Dropout <46.6 Vac rms
- 125 Vac: Pickup 89.6–150.0 Vac rms; Dropout <53.0 Vac rms
- 220 Vac: Pickup 150.3–264.0 Vac rms; Dropout <93.2 Vac rms
- 250 Vac: Pickup 170.6–300 Vac rms; Dropout <106 Vac rms
Current Drawn: <5 mA at nominal voltage
Current Drawn: <8 mA for 110 V option
Sampling Rate: 2 kHz

Communications Ports
EIA-232: 1 front and 3 rear
Serial Data Speed: 300–57600 bps

Ethernet Card Slot
Ordering Options: 100BASE-FX fiber-optic Ethernet
Mode: Multi
Wavelength (nm): 1300
Source: LED
Connector Type: LC
Min. TX Pwr. (dBm): –19
Max. TX Pwr. (dBm): –14
RX Sens. (dBm): –32
Sys. Gain (dB): 13

Time Inputs
IRIG-B Input—Serial Port 1
Input: Demodulated IRIG-B
Rated I/O Voltage: 5 Vdc
Operating Voltage Range: 0–8 Vdc
Logic High Threshold: ≥2.8 Vdc

Logic Low Threshold: ≤0.8 Vdc
Input Impedance: 2.5 kΩ

IRIG-B Input—BNC Connector
Input: Demodulated IRIG-B
Rated I/O Voltage: 5 Vdc
Operating Voltage Range: 0–8 Vdc
Logic High Threshold: ≥2.2 Vdc
Logic Low Threshold: ≤0.8 Vdc
Input Impedance: >1 kΩ
Rated Insulation Voltage: 150 Vdc

PTP—Ethernet Port 5A, 5B
Input: IEEE 1588 PTPv2
Profiles: Default, C37.238-2011 (Power Profile)
Synchronization Accuracy: ±100 ns @ 1-second synchronization intervals when communicating directly with master clock

Operating Temperature
–40° to +85°C (–40° to +185°F)

Note: LCD contrast impaired for temperatures below –20° and above +70°C. Stated temperature ranges not applicable to UL applications.

Humidity
5% to 95% without condensation

Weight
4U Rack Unit: 6.5 kg (14.5 lb)

Terminal Connections
Rear Screw-Terminal Tightening Torque, #8 Ring Lug
- Minimum: 1.0 Nm (9 in-lb)
- Maximum: 2.0 Nm (18 in-lb)
User terminals and stranded copper wire should have a minimum temperature rating of 105°C. Ring terminals are recommended.

Wire Sizes and Insulation
Wire sizes for grounding (earthing) and contact connections are dictated by the terminal blocks and expected load currents. You can use the following table as a guide in selecting wire sizes:

<table>
<thead>
<tr>
<th>Connection Type</th>
<th>Min. Wire Size</th>
<th>Max. Wire Size</th>

Class 2 Quake Response

Event Reports

High-Resolution Data

Rate:
8000 samples/second
4000 samples/second
2000 samples/second
1000 samples/second

Output Format:
Binary COMTRADE

Event Reports
Storage: 35 quarter-second events or 24 half-second events
Maximum Duration: Five records of 24 seconds each of 4000 samples/second

Event Summary
Storage: 100 summaries

Breaker History
Storage: 128 summaries

Sequential Events Recorder (SER)
Storage: 1000 entries
Trigger Elements: 250 relay elements
Resolution: 0.5 ms for contact inputs
1/8 cycle for all elements

Processing Specifications
AC Voltage and Current Inputs
8000 samples per second

Digital Filtering
Full-cycle cosine and half-cycle Fourier filters after low-pass analog and digital filtering.

Protection and Control Processing
8 times per power system cycle.

Control Points
32 remote bits
32 local control bits
32 latch bits in protection logic
32 latch bits in automation logic

Frequency and Rotation
Nominal Frequency Rating: 50 ± 5 Hz
60 ± 5 Hz
Phase Rotation: ABC or ACB
Frequency 40–65 Hz
Tracking Range: <40 Hz = 40 Hz
≥40 Hz = 65 Hz
Maximum Slew Rate: 15 Hz/s

Relay Element Pickup Ranges and Accuracies
Instantaneous/Definite-Time Overcurrent Elements
Phase, Residual Ground, and Negative-Sequence

Pickup Range
5 A Model: OFF, 0.25–100.00 A secondary, 0.01 A steps
1 A Model: OFF, 0.05–20.00 A secondary, 0.01 A steps

Accuracy (Steady State)
5 A Model: ±0.05 A plus ±3% of setting
1 A Model: ±0.01 A plus ±3% of setting

Transient Overreach:
Less than 5% of pickup

Time Delay:
0.000–16000 cycles, 0.125 cycle steps

Timer Accuracy:
±0.125 cycle plus ±0.1% of setting

Maximum Operating Time:
1.5 cycles

Time-Overcurrent Elements
Pickup Range
5 A Model: 0.25–16.00 A secondary, 0.01 A steps
1 A Model: 0.05–3.20 A secondary, 0.01 A steps

Accuracy (Steady State)
5 A Model: ±0.05 A plus ±3% of setting
1 A Model: ±0.01 A plus ±3% of setting

Time-Dial Range
U.S.: 0.50–15.00, 0.01 steps
IEC: 0.05–1.00, 0.01 steps

Curve Timing Accuracy:
±1.50 cycles plus ±4% of curve time (for current between 2 and 30 multiples of pickup)

Reset:
1 power cycle or Electromechanical Reset Emulation time

Harmonic Elements (2nd, 4th, 5th)

Neg.-Seq. Directional Impedance Threshold (Z2F, Z2R)
5 A Model: –64 to 64 Ω secondary
1 A Model: –320 to 320 Ω secondary

Zero-Seq. Directional Impedance Threshold (Z0F, Z0R)
5 A Model: –64 to 64 Ω secondary
1 A Model: –320 to 320 Ω secondary

Supervisory Overcurrent Pickup (50FP, 50RP)
5 A Model: 0.25 to 5.00 A 3I0 secondary
0.25 to 5.00 A 3I2 secondary
1 A Model: 0.05 to 1.00 A 3I0 secondary
0.05 to 1.00 A 3I2 secondary

Directional Power Elements

Pickup Range
5 A Model: –20000.00 to 20000 VA, 0.01 VA steps
1 A Model: –4000.00 to 4000 VA, 0.01 VA steps

Accuracy (Steady State):
±0.05 VA plus ±3% of setting at nominal frequency and voltage

Time-Delay:
0.00–16000.00 cycles, 0.25 cycle steps

Timer Accuracy:
±0.25 cycle plus ±1% of setting

Undervoltage and Overvoltage Elements

Pickup Ranges
300 V Maximum Inputs
Phase Elements: 2–300 V secondary, 0.01 V steps
Phase-to-Phase Elements: 4–520 V secondary, 0.01 V steps

Accuracy (Steady State):
Phase Elements: ±0.5 V plus ±3% of setting
Sequence Elements: ±0.5 V plus ±5% of setting

Transient Overreach:
<5% of pickup

Underfrequency and Overfrequency Elements

Pickup Range:
40.01–69.99 Hz, 0.01 Hz steps

Accuracy, Steady State plus Transient:
±0.005 Hz for frequencies between 40.00 and 70.00 Hz

Maximum Pickup/Dropout Time:
3.0 cycles

Time-Delay Range:
0.04–400.0 s, 0.01 s increments

Time-Delay Accuracy:
±0.1% ± 0.0042 s

Pickup Range, Undervoltage Blocking:
20–200 V LN (Wye)

Pickup Accuracy,
Undervoltage Blocking:
±2% ±0.5 V
Optional RTD Elements
(Models Compatible With SEL-2600 Series RTD Module)
12 RTD Inputs via SEL-2600 Series RTD Module and SEL-2800 Fiber-Optic Transceiver
Monitor Ambient or Other Temperatures
PT 100, NI 100, NI 120, and CU 10 RTD-Types Supported, Field Selectable
Pickup Range: Off, –50 to 250°C, 1°C step
Accuracy: ±2°C
As long as 500 m Fiber-Optic Cable to SEL-2600 Series RTD Module

Breaker Failure Instantaneous Overcurrent
Setting Range
5 A Model: 0.50–50.0 A, 0.01 A steps
1 A Model: 0.10–10.0 A, 0.01 A steps
Accuracy
5 A Model: ±0.05 A plus ±3% of setting
1 A Model: ±0.01 A plus ±3% of setting
Transient Overreach: <5% of setting
Maximum Pickup Time: 1.5 cycles
Maximum Reset Time: 1 cycle
Timers Setting Range: 0–6000 cycles, 0.125 cycle steps
(All but BFIDO, BFISP)
0–1000 cycles, 0.125 cycle steps (BFIDO, BFISP)
Time-Delay Accuracy: 0.125 cycle plus ±0.1% of setting

Synchronism-Check Elements
Slip Frequency
Pickup Range: 0.005–0.500 Hz, 0.001 Hz steps
Slip Frequency
Pickup Accuracy: ±0.0025 Hz plus ±2% of setting
Close Angle Range: 3–80°, 1° steps
Close Angle Accuracy: ±3° plus ±5% of setting

Load-Encroachment Detection
Setting Range
5 A Model: 0.05–64 Ω secondary, 0.01 Ω steps
1 A Model: 0.25–320 Ω secondary, 0.01 Ω steps
Forward Load Angle: –90° to +90°
Reverse Load Angle: +90° to +270°
Accuracy
Impedance Measurement: ±3%
Angle Measurement: ±2°

Timer Specifications
Setting Ranges
Breaker Failure: 0–6000 cycles, 0.125 cycle steps
(All but BFIDO, BFISP)
0–1000 cycles, 0.125 cycle steps (BFIDO, BFISP)
Communications-Assisted Tripping Schemes: 0.000–16000 cycles, 0.125 cycle steps
Pole Open Timer: 0.000–60 cycles, 0.125 cycle steps
Recloser: 1–999999 cycles, 1 cycle steps
Switch- Onto-Fault
CLOEND, 52AEND: OFF, 0.000–16000 cycles, 0.125 cycle steps
SOTFD: 0.500–16000 cycles, 0.125 cycle steps
Synchronism-Check Timers
TCLSBK1, TCLSBK2: 1.00–30.00 cycles, 0.25 cycle steps

Station DC Battery System Monitor Specifications
Rated Voltage: 24–250 Vdc
Operational Voltage Range: 0–300 Vdc
Sampling Rate: DC1: 2 kHz
DC2: 1 kHz
Processing Rate: 1/8 cycle
Operating Time: Less than 1.5 cycles (all elements except ac ripple)
Less than 1.5 seconds (ac ripple element)
Setting Range
15–300 Vdc, 1 Vdc steps (all elements except ac ripple)
1–300 Vac, 1 Vac steps (ac ripple element)
Accuracy
Pickup Accuracy: ±3% ± 2 Vdc (all elements except ac ripple)
±10% ± 2 Vac (ac ripple element)

Metering Accuracy
All metering accuracy is at 20°C, and nominal frequency unless otherwise noted.

currents
Phase Current Magnitude
5 A Model: ±0.2% plus ±4 mA (2.5–15 A sec)
1 A Model: ±0.2% plus ±0.8 mA (0.5–3 A sec)
Phase Current Angle
All Models: ±0.2° in the current range 0.5 • I NOM to 3.0 • I NOM
Sequence Currents Magnitude
5 A Model: ±0.3% plus ±4 mA (2.5–15 A sec)
1 A Model: ±0.3% plus ±0.8 mA (0.5–3 A sec)
Sequence Current Angle
All Models: ±0.3° in the current range 0.5 • I NOM to 3.0 • I NOM

Voltages
Phase and Phase-to-Phase Voltage Magnitude: ±0.1% (33.5–300 V L-N)
Phase and Phase-to-Phase Angle: ±0.5° (33.5–300 V L-N)
Sequence Voltage Magnitude: ±0.1% (33.5–300 V L-N)
Sequence Voltage Angle: ±0.5° (33.5–300 V L-N)

Frequency (Input 40–65 Hz)
Accuracy: ±0.01 Hz

Power
MW (P), Per Phase (Wye), 3Φ (Wye or Delta) Per Terminal
±1% (0.1–1.2) • I NOM, 33.5–300 Vac, PF = 1, 0.5 lead, lag (1Φ)
±0.7% (0.1–1.2) • I NOM, 33.5–300 Vac, PF = 1, 0.5 lead, lag (3Φ)
MVA (S), Per Phase (Wye), 3Φ (Wye or Delta) Per Terminal
±1% (0.1–1.2) • I NOM, 33.5–300 Vac, PF = 1, 0.5 lead, lag (1Φ)
±0.7% (0.1–1.2) • I NOM, 33.5–300 Vac, PF = 1, 0.5 lead, lag (3Φ)
PF, Per Phase (Wye), 3Φ (Wye or Delta) Per Terminal
±1% (0.1–1.2) • I NOM, 33.5–300 Vac, PF = 1, 0.5 lead, lag (1Φ)
±0.7% (0.1–1.2) • I NOM, 33.5–300 Vac, PF = 1, 0.5 lead, lag (3Φ)
Energy

MWh (P), Per Phase (Wye), 3φ (Wye or Delta)

±1% (0.1–1.2) \* I_{NOM} = 33.5–300 Vac, PF = 1, 0.5 lead, lag (1φ)

±0.7% (0.1–1.2) \* I_{NOM} = 33.5–300 Vac, PF = 1, 0.5 lead, lag (3φ)

Synchrophasors

- Number of Synchrophasor Data Streams: 5
- Number of Synchrophasors for Each Stream: 15 phase synchrophasors (6 voltage and 9 currents)
- Number of User Analogs for Each Stream: 16 (any analog quantity)
- Number of User Digitals for Each Stream: 64 (any Relay Word bit)
- Synchrophasor Protocol: IEEE C37.118, SEL Fast Message (Legacy)
- Synchrophasor Data Rate: As many as 60 messages per second
- Synchrophasor Accuracy:
  - Voltage Accuracy: ±1% Total Vector Error (TVE), Range 30–150 V, f_{NOM} ±5 Hz
  - Current Accuracy: ±1% Total Vector Error (TVE), Range (0.1–20) \* I_{NOM}, f_{NOM} ±5 Hz
  - Synchrophasor Data Recording: Records as much as 120 s

Number of User Analogs for Each Stream: 16 (any analog quantity)
Number of User Digitals for Each Stream: 64 (any Relay Word bit)
Synchrophasor Protocol: IEEE C37.118, SEL Fast Message (Legacy)
Synchrophasor Data Rate: Up to 60 messages per second
Synchrophasor Accuracy:
- Voltage Accuracy: ±1% Total Vector Error (TVE), Range 30–150 V, f_{NOM} ±5 Hz
- Current Accuracy: ±1% Total Vector Error (TVE), Range (0.1–20) \* I_{NOM}, f_{NOM} ±5 Hz
- Synchrophasor Data Recording: Records up to 120 s

Technical Support

We appreciate your interest in SEL products and services. If you have questions or comments, please contact us at:
