SEL-751

Feeder Protection Relay

2 ms arc-flash protection and feeder relay in one platform

- Support low-energy analog (LEA) voltage sensor inputs and Rogowski coil or low-power current transformer (LPCT) inputs in small-enclosure installations.
- Detect open-phase conditions with phase discontinuity detection logic.
- Prevent faults caused by broken conductors on single-circuit lines using broken-conductor detection, and mitigate possible fire hazards.
- Safely re-energize your system after an extended outage with the cold-load pickup element.
- Improve network recovery via alternate paths in a network with the Rapid Spanning Tree Protocol (RSTP).

*Optional Feature

81 (O,U,R,RF) Over-/Underfrequency (Rate, Fast Rate)*

Key Features

Feeder Protection

Protect radial and looped distribution circuits with comprehensive protection capabilities, including time overcurrent, directional overcurrent, autoreclosing, over-/undervoltage, frequency, cable/line thermal, and more.

LEA Sensor Inputs

Apply the SEL-751 in applications that use low-energy current/voltage sensors. LEA sensors for measurement of primary voltages and currents offer excellent linearity, a wide dynamic range, reduced size and weight, and enhanced personnel safety. The LEA current/voltage input card supports three current channels that are either Rogowski coil or low-power current inputs, three LEA voltage sensor inputs, and one 200 mA neutral input. LEA current and voltage channels accept an RJ45 connector input, and the 200 mA neutral channel accepts a terminal block input.

Expanded Arc-Flash Solutions

Improve safety with options for either four or eight arc-flash detection (AFD) inputs to improve arc-flash coverage. The SEL-751 Feeder Protection Relay offers combined light and high-speed overcurrent detection for arc-flash events. This combination provides the ideal solution for speed and security.

Sensitive Earth Fault (SEF) Protection

Improve ground protection with the 200 mA neutral input. You can protect ungrounded, solidly grounded, Petersen coil-grounded, or other impedance-grounded systems with a sensitive 67N or 50N element for directional or nondirectional ground overcurrent, respectively.

High-Impedance Fault Detection

Detect downed conductors, even on poorly conducting surfaces, with Arc Sense technology (AST). AST algorithms detect arcing produced by some highimpedance faults and will send an alarm or trip the breaker. This technology provides an added level of protection over conventional feeder protection methods.

Islanding Protection

Detect islanding conditions using the vector shift function. The SEL-751 quickly identifies waveform changes during islanding operations and provides logic to support a systematic response to changing grid conditions.

Cold-Load Pickup Element

Cold-load pickup is the phenomenon that takes place when a distribution circuit is re-energized following an extended outage of that circuit. Cold-load pickup can result in current levels that are significantly higher than normal peak load levels. This excess amount of current draw could be falsely identified as an overcurrent condition by the relay. The cold-load pickup element identifies possible coldload pickup events per the settings in a distribution line after an outage.

Incipient Cable Fault Detection

Cable insulation degrades over time. The incipient cable fault detection element can monitor for self-extinguishing, half-cycle overcurrent events that precede typical cable insulation failure. Monitoring the number of incipient faults can provide an early warning of cable insulation breakdown for preventative maintenance.

Automation and Control

Apply the SEL-751 on feeders to provide protection, automation, and control capabilities, all in one package. SELOGIC torque control equations support many automated applications without the need for additional automation controllers. The configurable front-panel pushbuttons can replace conventional panel controls and simplify overall applications and wiring. The 14 digital inputs (DI) card option expands available contact inputs for enhanced automation solutions.

Thermal Protection

Protect cable and feeder insulation against thermal damage using the IEC 49 cable/line thermal element. It extends conductor life and provides backup protection for the overcurrent elements.

Event Analysis

Conduct post-event analysis more efficiently with detailed event records. You can combine oscillographic and digital information to find root cause. Adding a satellite-synchronized time source, like an SEL satellite-synchronized clock (e.g., SEL-2401 or SEL-2407[®]), provides convenient alignment of event information from multiple devices.

Reliable in Harsh Environments

All SEL relays are designed to operate in harsh environments where other relays may fail. The SEL-751 operates in extreme conditions, with an operating temperature of -40° to $+85^{\circ}$ C (-40° to $+185^{\circ}$ F), and is designed and tested to exceed applicable standards, including vibration, electromagnetic compatibility, and adverse environmental conditions. In addition, the SEL-751 is ATEX- and Underwriters Laboratories (UL) Class I, Division 2-certified for use in hazardous and potentially explosive environments.

Open Conductors Detection

Apply the SEL-751 to detect and isolate open conductors. The SEL-751 incorporates phase discontinuity detection and optional broken conductor detection to provide a reliable solution for open-conductor faults that convert to high-impedance faults.

Wildfire Risk Reduction

Identify downed conductors and minimize wildfire risk by detecting high-impedance faults. SEL's unique AST detects and clears faults that might not be detected by traditional overcurrent protection.

Flexible Communications

Advanced protocols support communications using legacy and modern supervisory and control systems. These protocols include IEC 61850 Edition 2, RSTP, EtherNet/IP, the IEEE 1588 Precision Time Protocol (PTP) (firmwarebased), IEC 60870-5-103, DNP3, Modbus TCP/IP, Telnet, the File Transfer Protocol (FTP), the Simple Network Time Protocol (SNTP), MIRRORED BITS communications, and ASCII. In addition, the IEC 61850 test mode in the SEL-751 enables in-service testing, which reduces commissioning time.

Product Overview

Touchscreen Overview

Conventional CT and PT Input Option

LEA Current and Voltage Inputs Option

*Compliant with IEC 61869-10, -11 standards.

Touchscreen Display Features and Functions

The SEL-751 5-inch, 800 × 480 color touchscreen display mimics a one-line diagram for bay control and monitoring. With it, you can view metered quantities, phasor diagrams, relay settings, event summaries, target statuses, and Sequential Events Recorder (SER) data.

Bay Screens and Bay Control

Select from predefined bay screens, or configure as many as five custom bay screens using the ACSELERATOR[®] Bay Screen Builder SEL-5036 Software and ACSELERATOR QuickSet[®] SEL-5030 Software. You can control one breaker, eight two-position disconnects, and two three-position disconnects and can view analog and digital data in a contextual display.

To control a breaker or disconnect, simply tap the Bay Screens application on the home screen and then the breaker or disconnect you want to control.

Next, enter your Level 2 password and tap Submit. The onscreen keyboard allows you to quickly and easily enter passwords, search for Relay Word bits, and enter settings.

Applications

Feeder Protection

Provide comprehensive protection capabilities, including time overcurrent, directional overcurrent, over-/undervoltage, autoreclosing, frequency, and much more.

Sensitive 67N or 50N for Grounded Systems

With the 200 mA neutral current input, the SEL-751 is ideal for sensitive-ground directional or nondirectional overcurrent protection applications in systems with a wide variety of grounding configurations. The sensitive neutral element detects ground faults and identifies whether the ground fault is forward or reverse of the protective device.

Coordinate Protection

Use SEL MIRRORED BITS OF IEC 61850 GOOSE communications to coordinate upstream protection if a fault occurs. Coordination and fast bus trip schemes allow short delays (two or three cycles) for backup protection, reducing arc-flash energy.

Reduce Arc-Flash Hazards

The SEL-751 combines light-sensing technology with fast overcurrent protection to provide high-speed arc-flash detection as fast as 2 milliseconds without false tripping.

Fast and secure arc-flash mitigation reduces the incident energy of arc-flash events. SEL-751 relays also have integration and communications features for secure remote access to help you keep out of the danger zone while gathering important real-time and historical data from the relays. You can coordinate protection for faster clearing times and stay outside the danger zone completely with wireless or remote communications.

If you must be in the danger zone, know the dangers and wear appropriate personal protective equipment. If you do not know the arc-flash ratings and zones for your gear, the SEL Engineering Services team provides professional arcflash hazard studies and practical approaches to mitigate arc-flash risks.

Arc-Flash Mitigation

Improve safety and prevent damage with arc-flash detection in the SEL-751. Point sensors, window sensors, loop sensors, or a combination protect a variety of switchgear configurations. You can order either four or eight arc-flash sensor inputs. The high-speed output contacts obtain the fastest response to arcing faults.

Easy to Set and Use

Use QuickSet Software to Set, Monitor, and Control the SEL-751

With QuickSet, you can:

- Save engineering time while keeping flexibility. Communicate with the SEL-751 through any ASCII terminal, or use the QuickSet graphical user interface.
- Develop settings offline with a menu-driven interface and completely documented help screens. You can speed up installation by copying existing settings files and modifying application-specific items.
- Simplify the setting procedure with the rules-based architecture to automatically check interrelated settings. Out-of-range or conflicting settings are highlighted for correction.

Use SEL-5601-2 SYNCHROWAVE® Event Software to Retrieve and Display Event Reports Recorded by the SEL-751

With SYNCHROWAVE software, you can:

- Display event report oscillograms. You can view each report as a plot of magnitude versus time and select analog and digital points to build a custom display. You can analyze arc-flash events using light intensity and phase current waveforms recorded during the arc fault.
- Display phase and symmetrical component phasors. Displaying the phasor view of electrical data helps you better understand asymmetrical, three-phase faults. You can build a custom plot using per-phase and symmetrical component sequence currents and voltages.
- Retrieve event reports using serial or Ethernet communications links.

Get Information Easily With the Integrated Web Server

Access basic SEL-751 information on a standard Ethernet network with the built-in web server. You can view the relay status, SER data, metering information, and settings with easy access within a local network. For increased security, web server access requires a relay password and the information is limited to a read-only view. You can also upgrade relay firmware through the web server.
